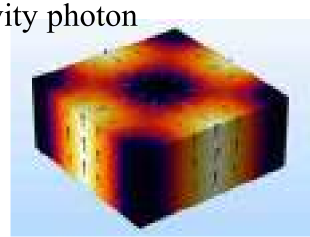
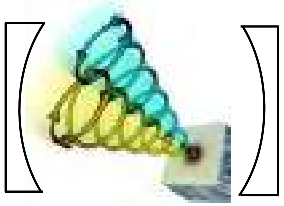
Introduction to cavity-magnon-polariton (CMP)

Cavity photon



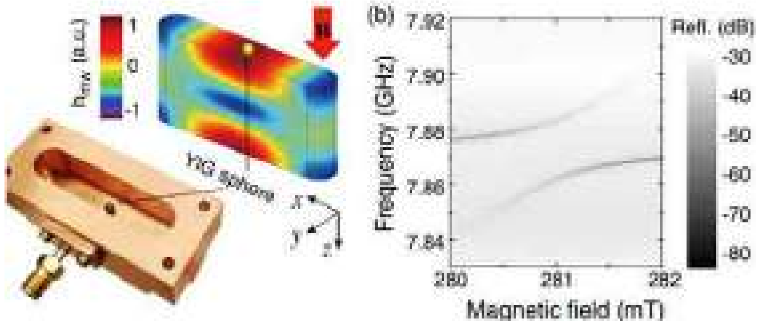
Spin wave (magnon)

CMP



Coupling Mechanics of CMP

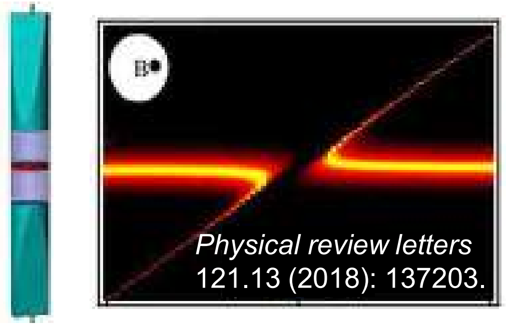
Coherent coupling



Physical review letters 113.15 (2014): 156401.

Level repulsion has been widely studied in CMP

Dissipative coupling



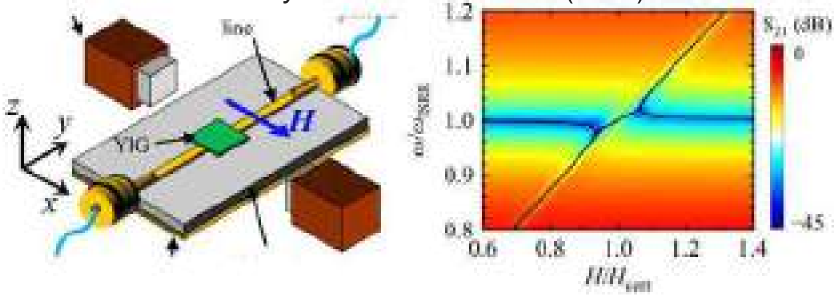
Physical review letters
121.13 (2018): 137203.

Discovery of **level attraction** in CMP

My research is focused on dissipative coupling.

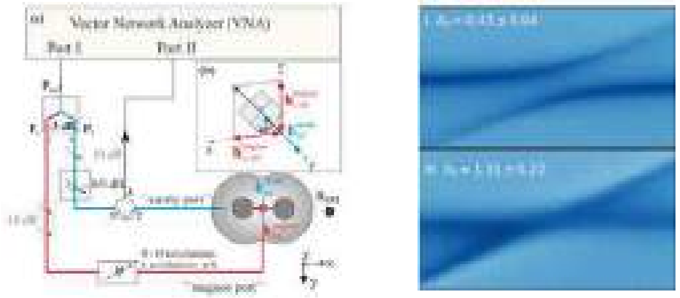
What we can make use of dissipative coupling?

Physical Review B 99.13 (2019): 134426.



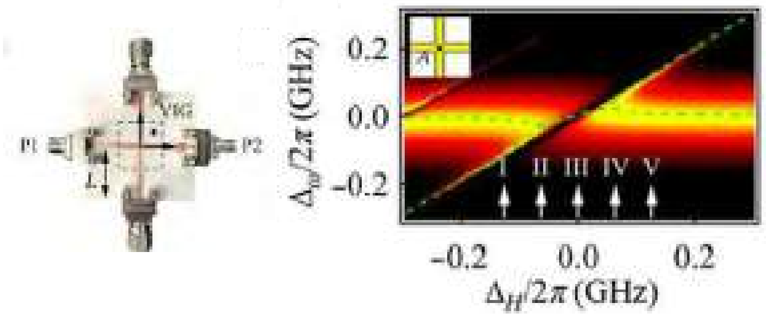
On-chip level attraction with planar YIG

Physical Review Research 2.1 (2020): 013154.



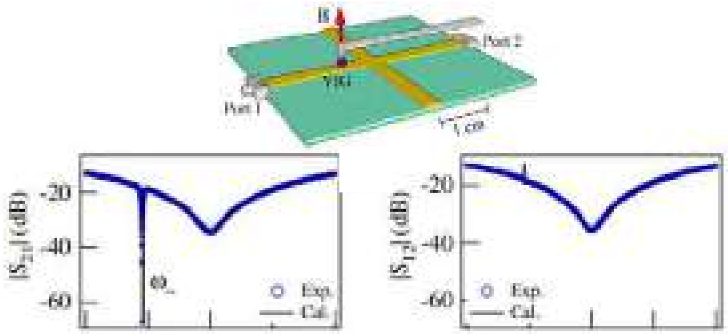
Linewidth control use level merging

On-chip device utilizing level attraction



Physical Review Applied 11.5 (2019): 054023.

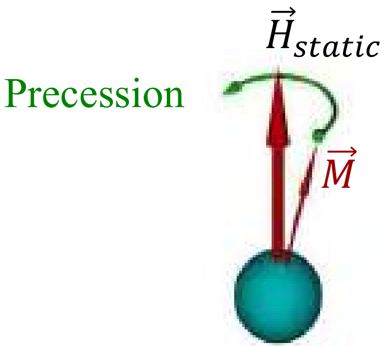
Nonreciprocal microwave transmission



Physical review letters 123.12 (2019): 127202.

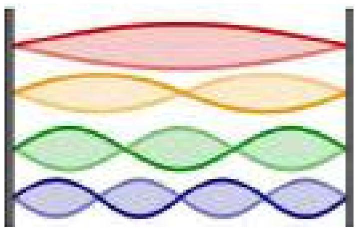
How do we understand CMP?

- Coupled photon and magnon



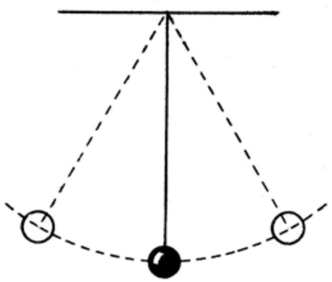
Ferromagnetic resonance

Standing wave



Photon cavity resonance

→ Periodic motion



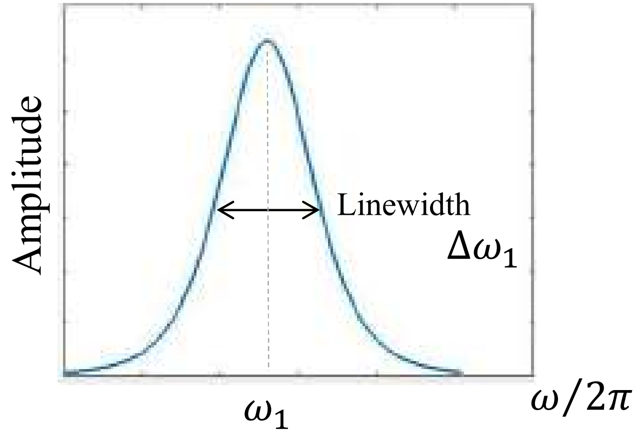
Simplified to Pendulum

Complex frequency

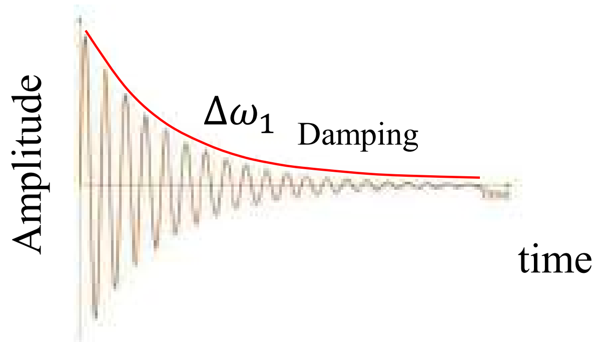
$$\widetilde{\omega}_1 = \omega_1 - i\Delta\omega_1$$

Resonance (real) + damping (imaginary)

Frequency response

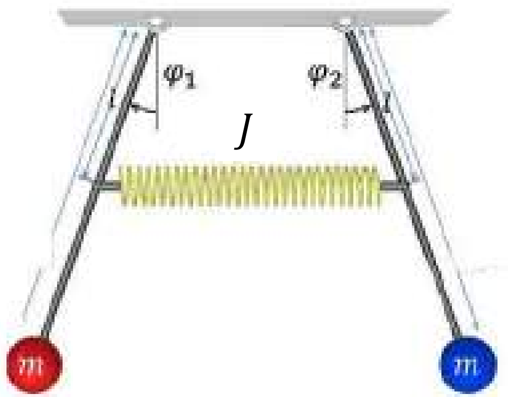


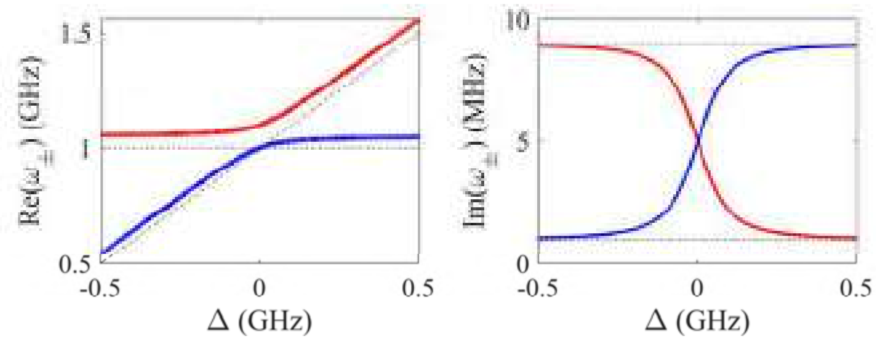
Time-domain response



Coherent coupled pendulums

Schematic – Spring





Equation of motion:

$$\ddot{\varphi}_1 + 2\lambda_1\dot{\varphi}_1 + \omega_1^2\,\varphi_1 \; - 2\omega_1\,J(\varphi_2 - \varphi_1) = 0$$

$$\ddot{\varphi}_2 + 2\lambda_2\dot{\varphi}_2 + \omega_2^2\,\varphi_2 \; - 2\omega_2\,J(\varphi_1 - \varphi_2) = 0$$

Matrix form

$$\begin{bmatrix} \omega - \widetilde{\omega}_1 - J & J \\ J & \omega - \widetilde{\omega}_2 - J \end{bmatrix} \begin{bmatrix} |\varphi_1| \\ |\varphi_2| \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

coupling = Real

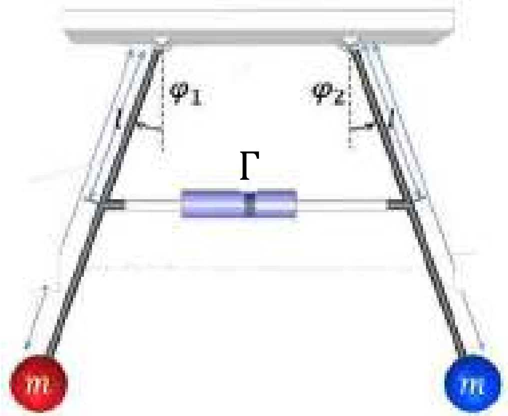
→ Conservative force

→ Level repulsion

→ Linewidth exchange

Dissipative coupled pendulums

Schematic – Dashpot



Matrix form

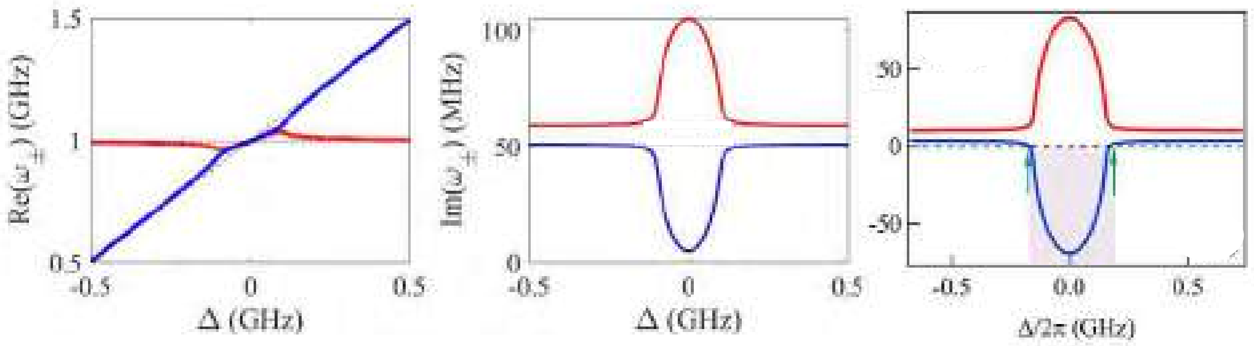
$$\begin{bmatrix} \omega - \tilde{\omega}_1 - i\Gamma & i\Gamma \\ i\Gamma & \omega - \tilde{\omega}_2 - i\Gamma \end{bmatrix} \begin{bmatrix} |\varphi_1| \\ |\varphi_2| \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

coupling $=$ imaginary

→ Nonconservative force

Mechanical systems

Polariton systems



Green arrow → zero damping

Shade area → negative damping

→ Level attraction

→ Linewidth "repulsion"

Numerical methods for time domain analysis

Equation of motion:

$$\dot{\varphi}(t) = f(\varphi(t), t)$$

→ Ordinary Differential Equations (ODEs)

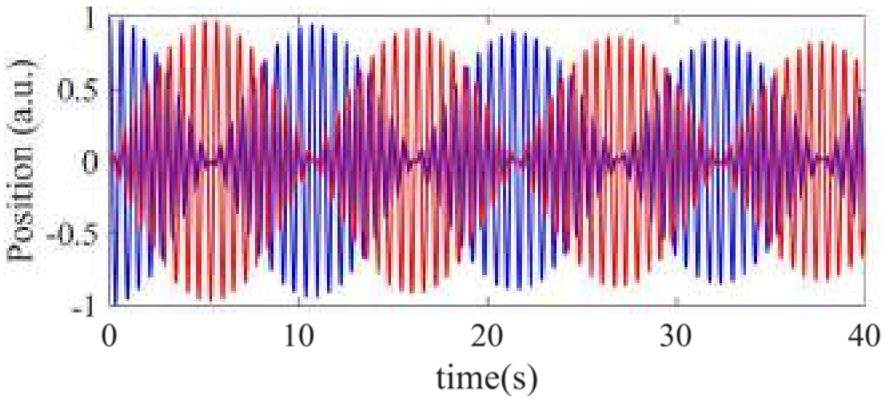
Next moment | This moment (initial conditions)

$$\varphi(t_{n+1}) = \varphi(t_n) + \int_{t_n}^{t_{n+1}} f(\varphi(t), t)\, dt$$

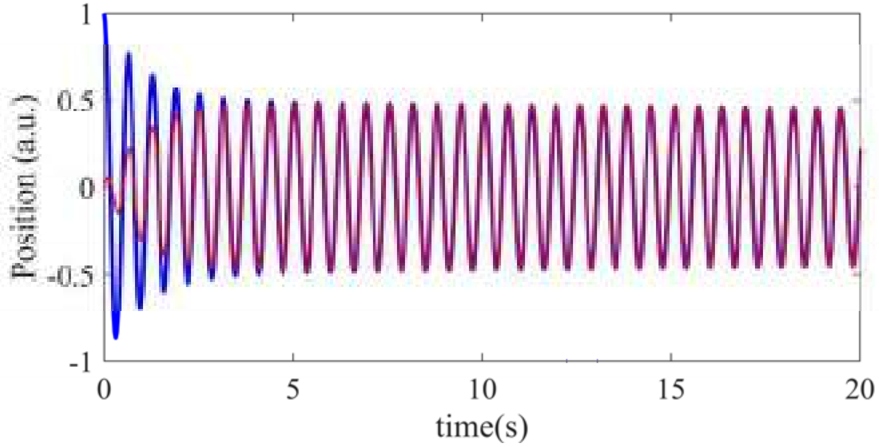
Numerical approximation $\quad f(\varphi(t), t) \sim \text{constant}$

$$\varphi(t_{n+1}) = \varphi(t_n) + f(\varphi(t), t)(t_{n+1} - t_n)$$

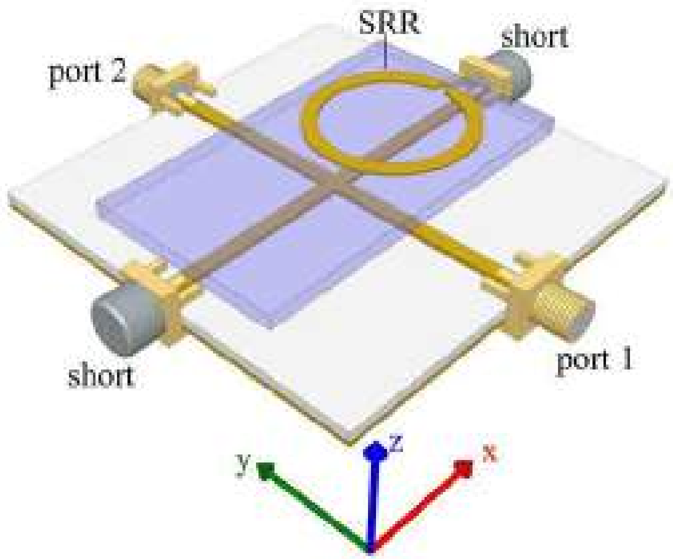
Coherent coupling - Rabi Oscillation like

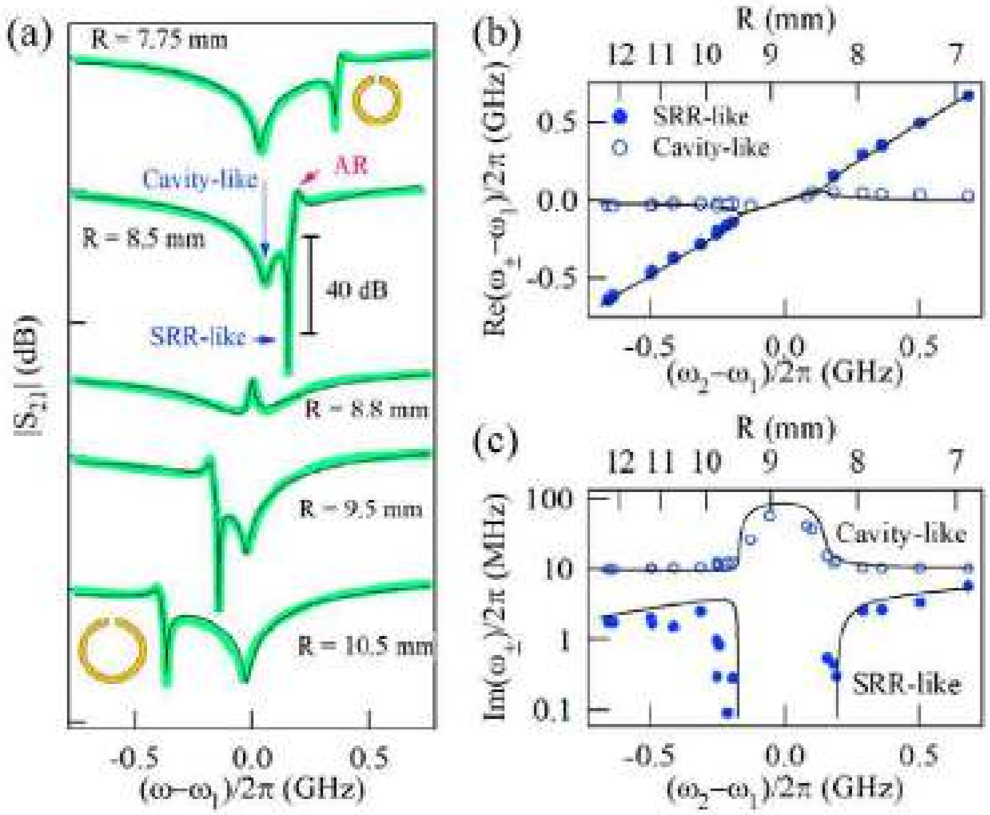


Dissipative coupling - Synchronization like



Dissipative coupling in metamaterials





Level attraction

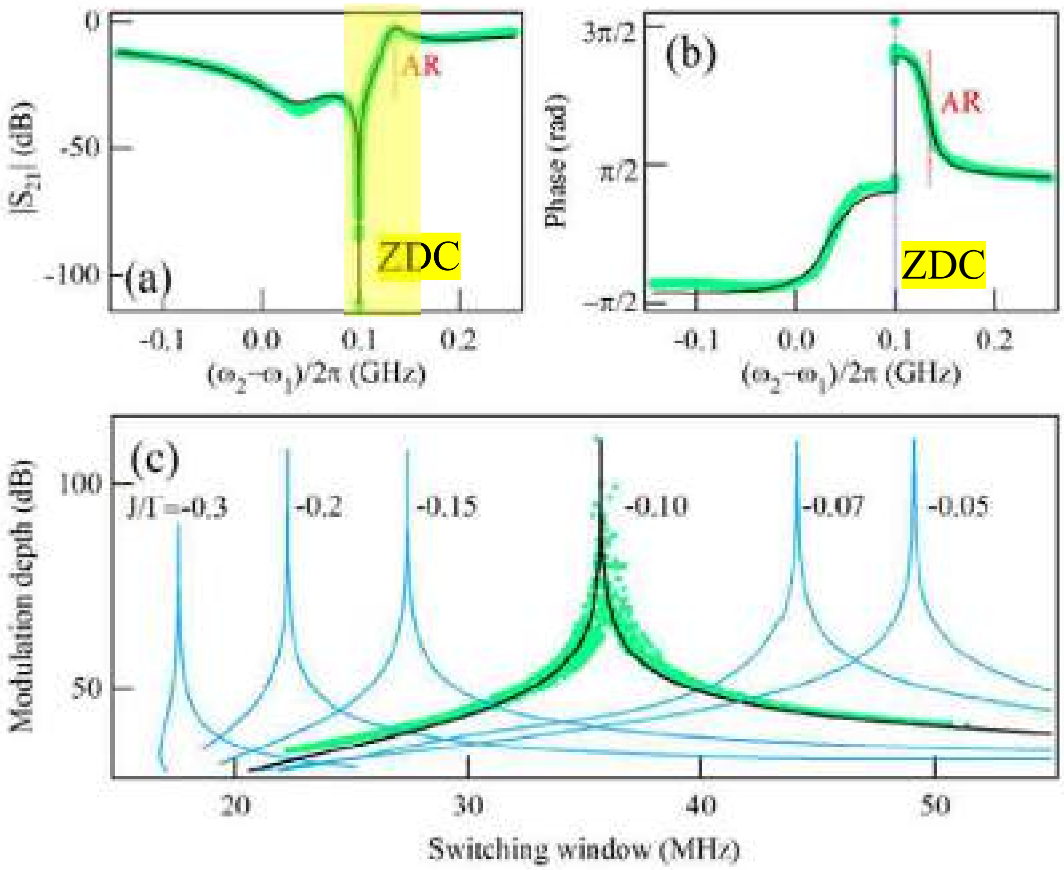
Linewidth Narrowing

Experiment design

Measured Spectra

Dispersion

Transmission transition from 0 to 1



Asymmetry resonance is a typical Fano resonance

We have observed a transition from 0 to 1 in transmission.

1 → on

0 → off

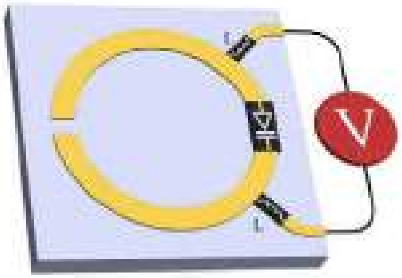
Potential to design switching device.

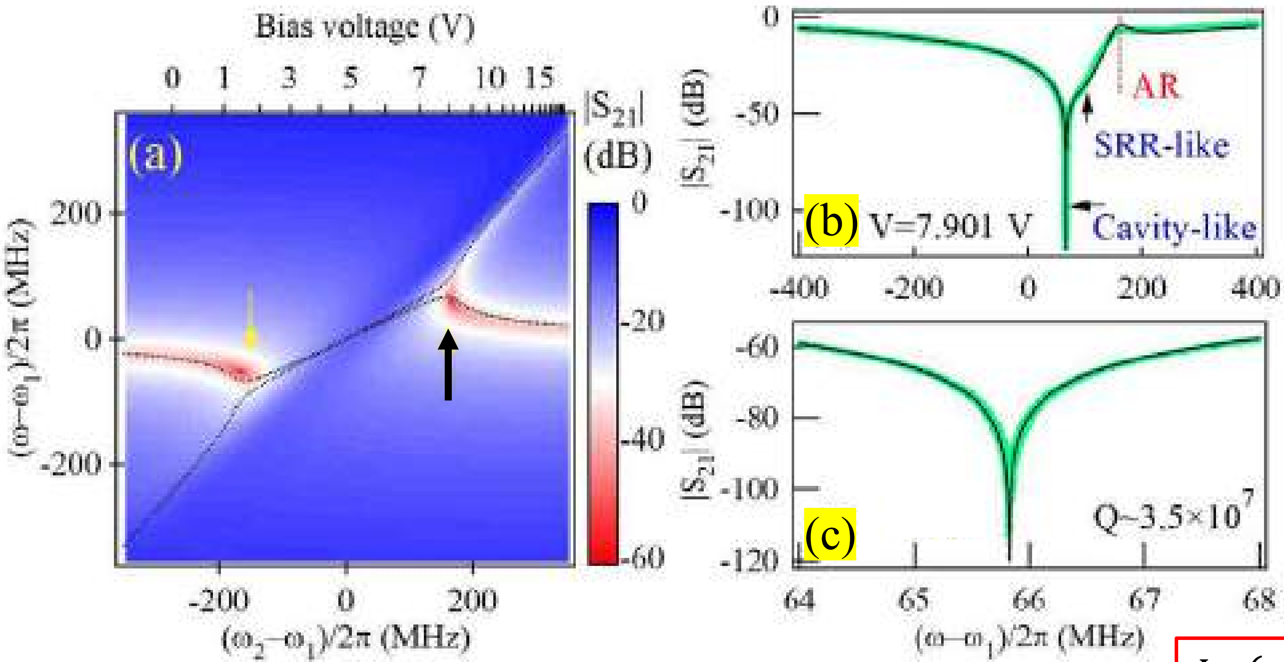
Smaller window → high performance

Voltage-controlled level attraction

Varactor loaded split-ring resonator

$$\omega_{srr} = \frac{1}{\sqrt{LC}}$$



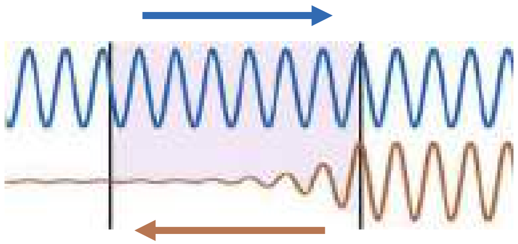


$\boxed{Im(\omega_c) = 30\ Hz!}$

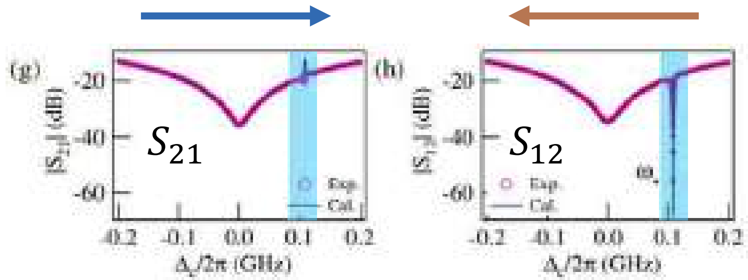
Ultra-high Quality factor → sensitive detection / sensor design

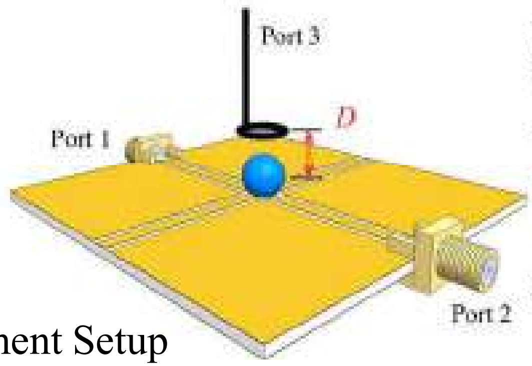
Nonreciprocity in cavity magnon polariton

Wang, Yi-Pu, et al. "Nonreciprocity and unidirectional invisibility in cavity magnonics." *Physical review letters* 123.12 (2019): 127202.

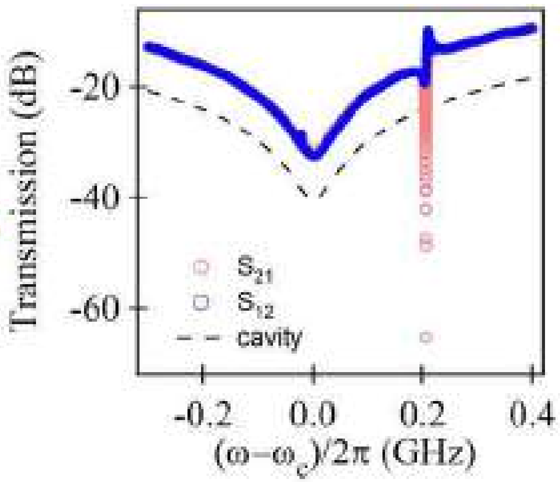


Unidirectional transmission





Experiment Setup



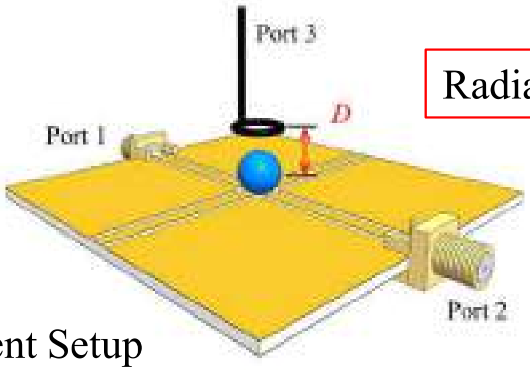
Iso. (dB)= $|S_{21}-S_{12}|$

For Iso. >20db

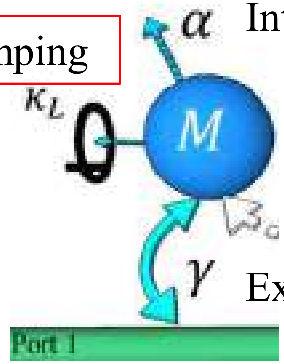
Bandwidth ~ 0.5 MHz

~ magnon linewidth

Local control of magnon damping



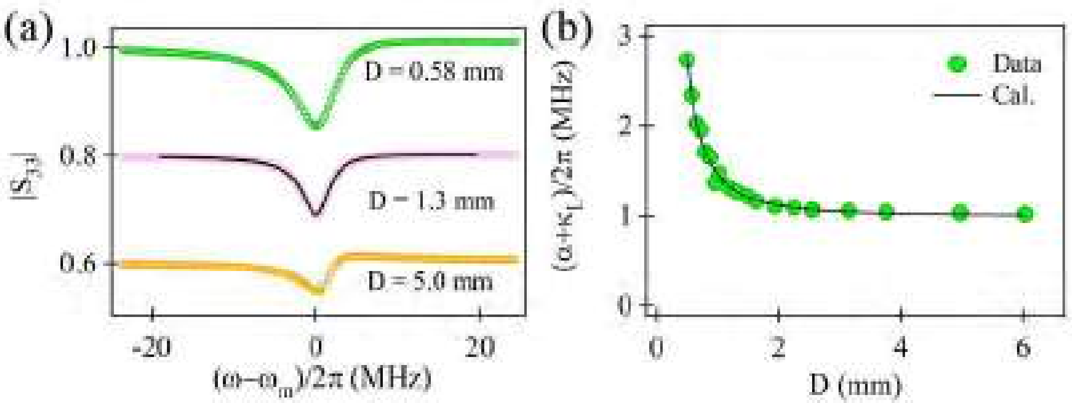
Experiment Setup



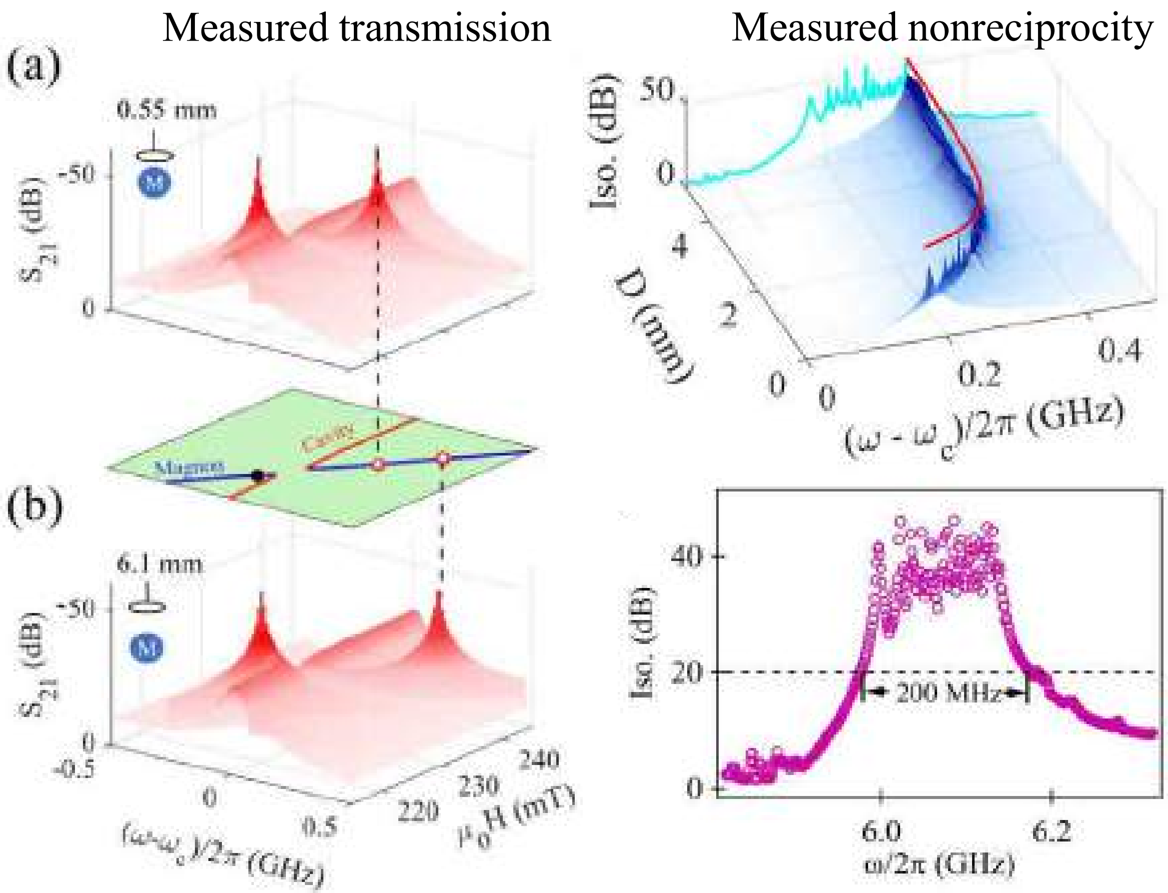
Radiation damping

Intrinsic damping

External damping



Broadband nonreciprocal device



Hundreds time of improvement!

Summary of Contribution

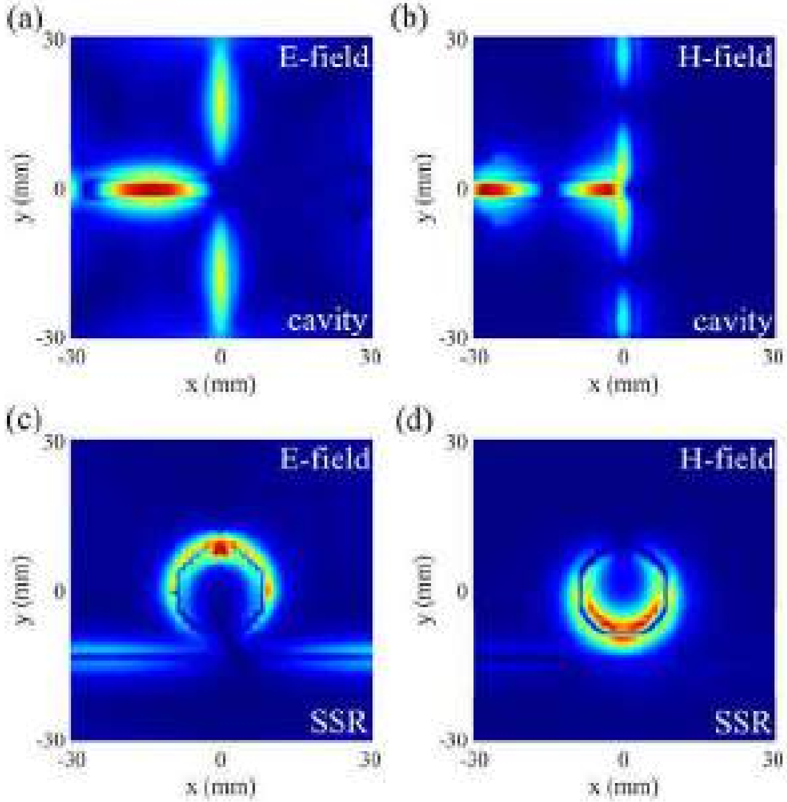
1. We proposal a numerical method to analysis time-domain signal and have potential to study non-linear and chaotic effects in dissipative coupling.

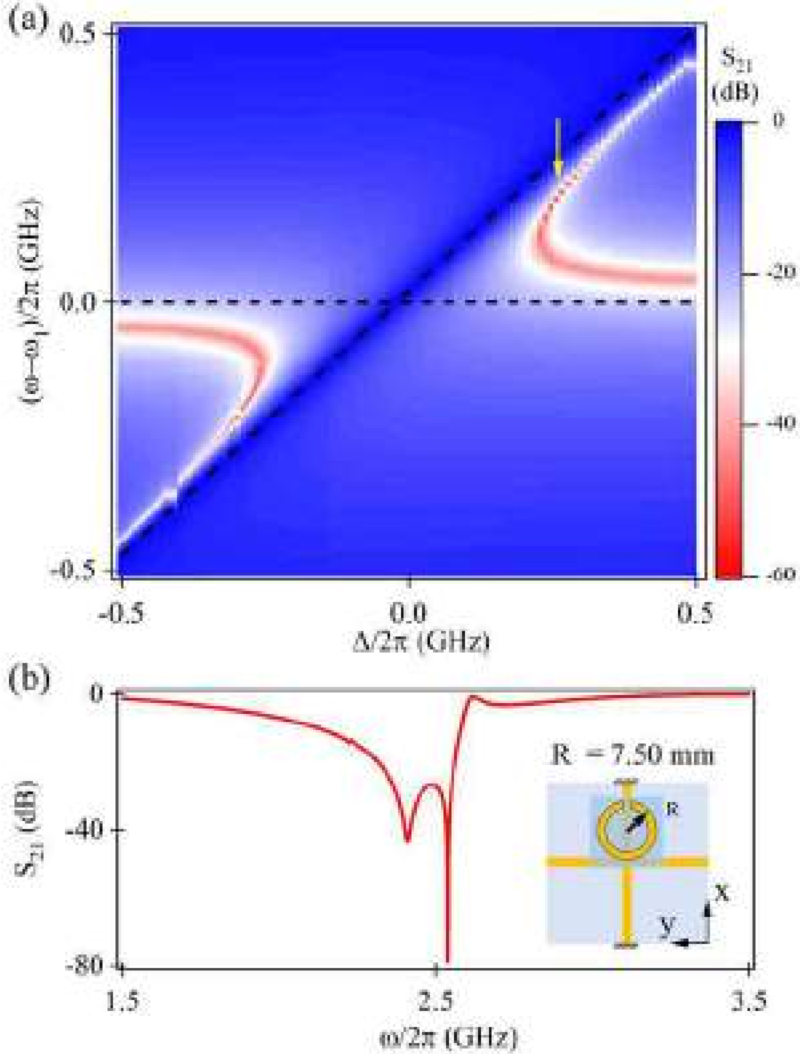
2. Dissipatively coupled metamaterials for sensitive detectors, switching device.

3. Broadband nonreciprocal device by locally control magnon damping in CMP.

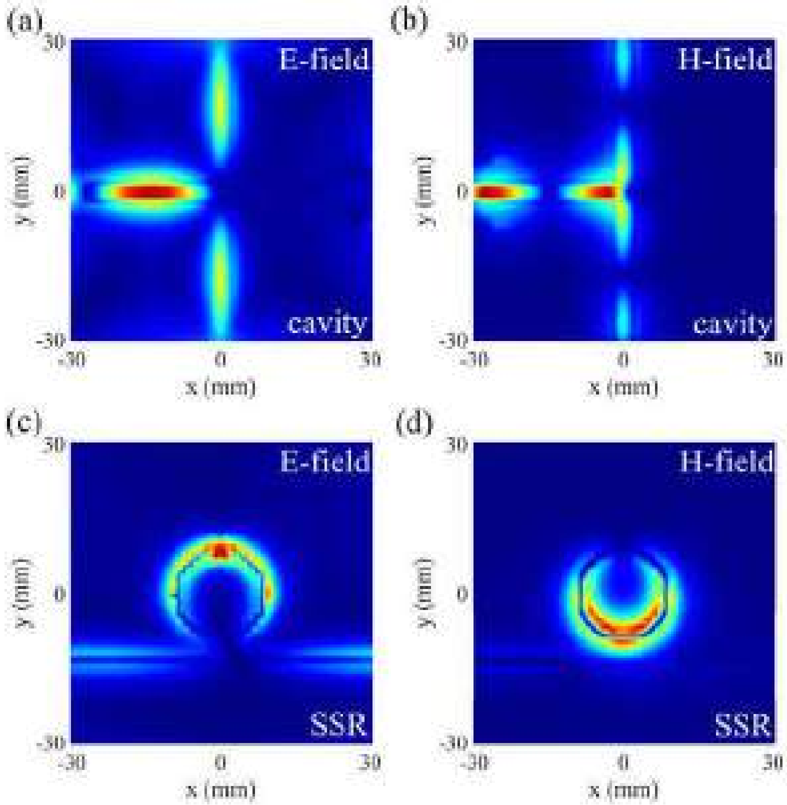
Additional Information for Clarification

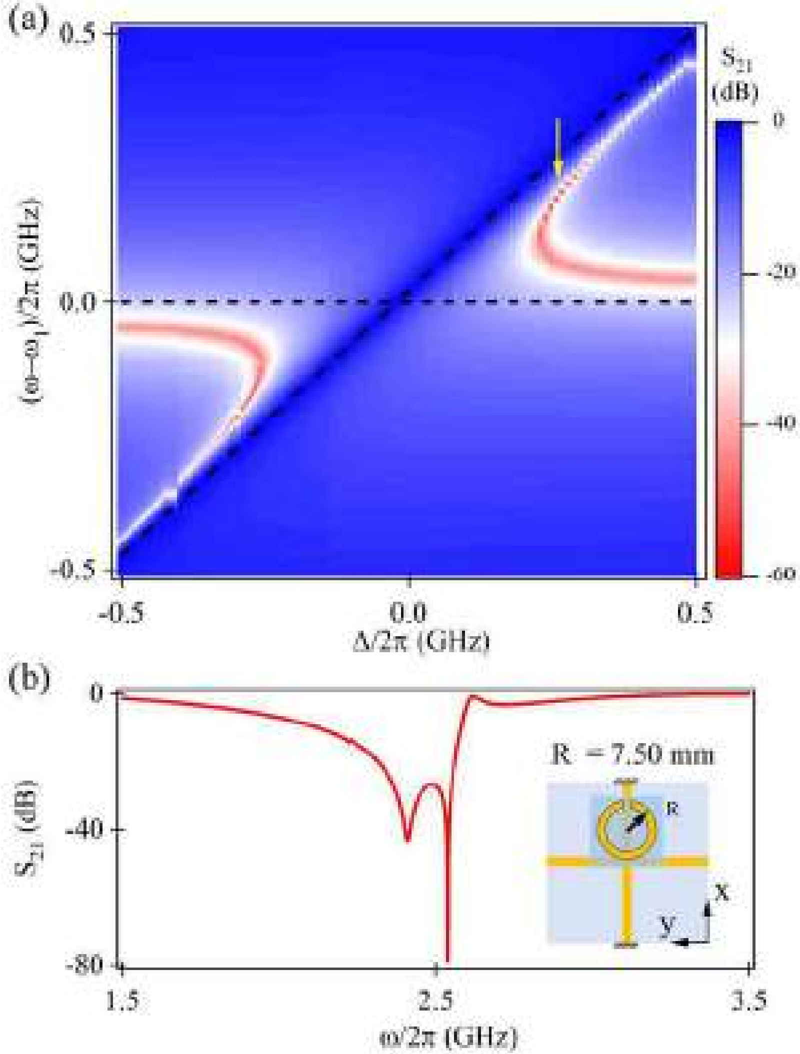
Level attraction in Simulation





Level attraction in Simulation (2)





Magnetic Resonance of Split-ring Resonator

Three ways to excite resonance of an SRR.

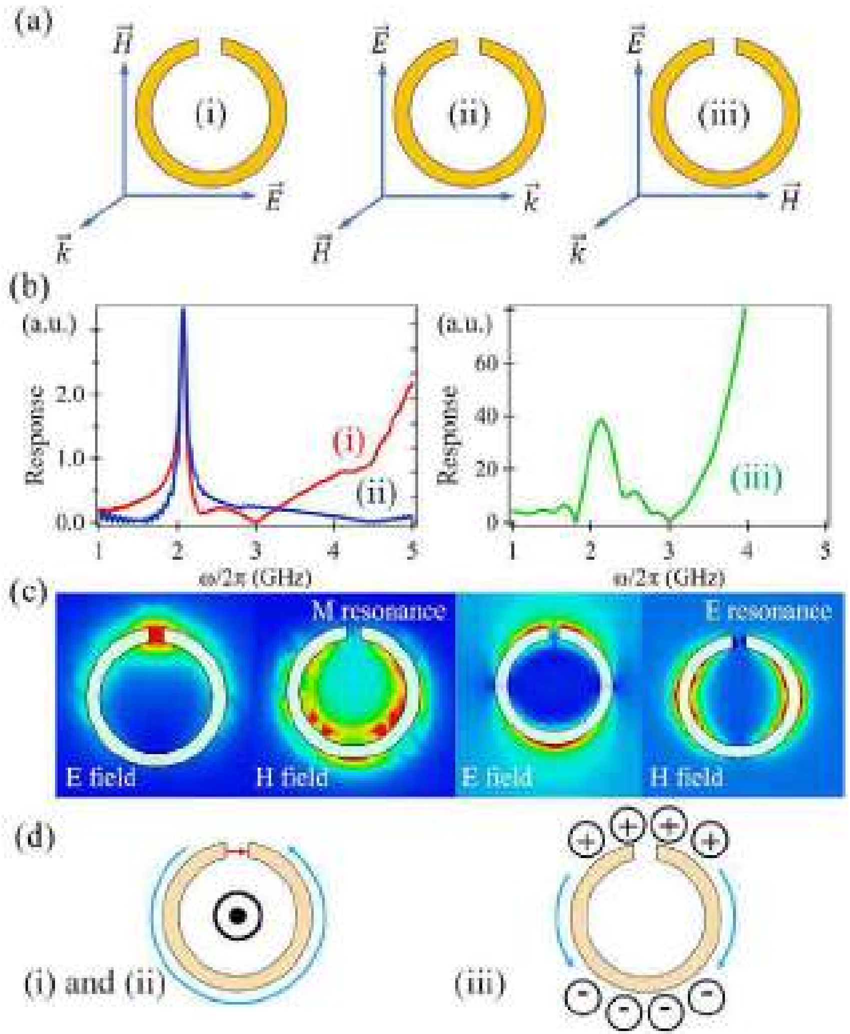
(i) Electric coupling to magnetic resonance

(ii) Magnetic coupling to magnetic resonance

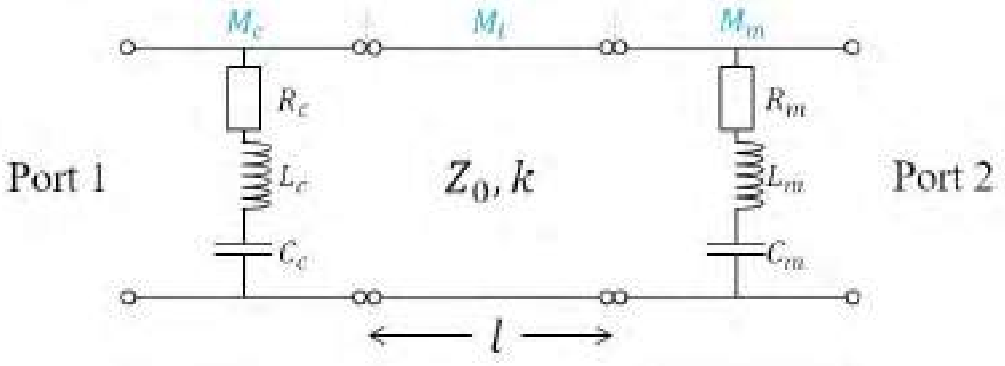
(iii) Electric coupling to electric resonance

(i) + (ii) → magnetic dipole in z-direction

(iii) → electric dipole in y-direction



Classical circuit model for level attraction



Impedance Z → transmission matrix (ABCD) → Scattering matrix (S_{21} & S_{11})

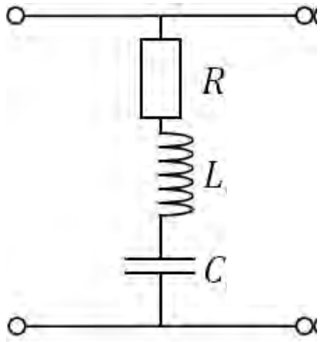
$$S_{21} \approx 1 + \frac{\kappa}{i(\omega - \omega_1) - (\beta + \kappa) + \dfrac{\kappa\gamma e^{i(2kl+\pi)}}{i(\omega - \omega_m) + \alpha + \gamma}}$$

Equivalent to
Hamiltonian model

Two classical RLC oscillator coupled with a transmission line.

This model confirms the importance of travelling wave in this system.

Negative damping/resistance



Single RLC resonator in a Two-port Network

$$S_{21} = 1 - \frac{\kappa}{i(\omega - \omega_1) + \kappa + \gamma},$$

$\omega_1 = 1/\sqrt{LC}$ – resonance frequency

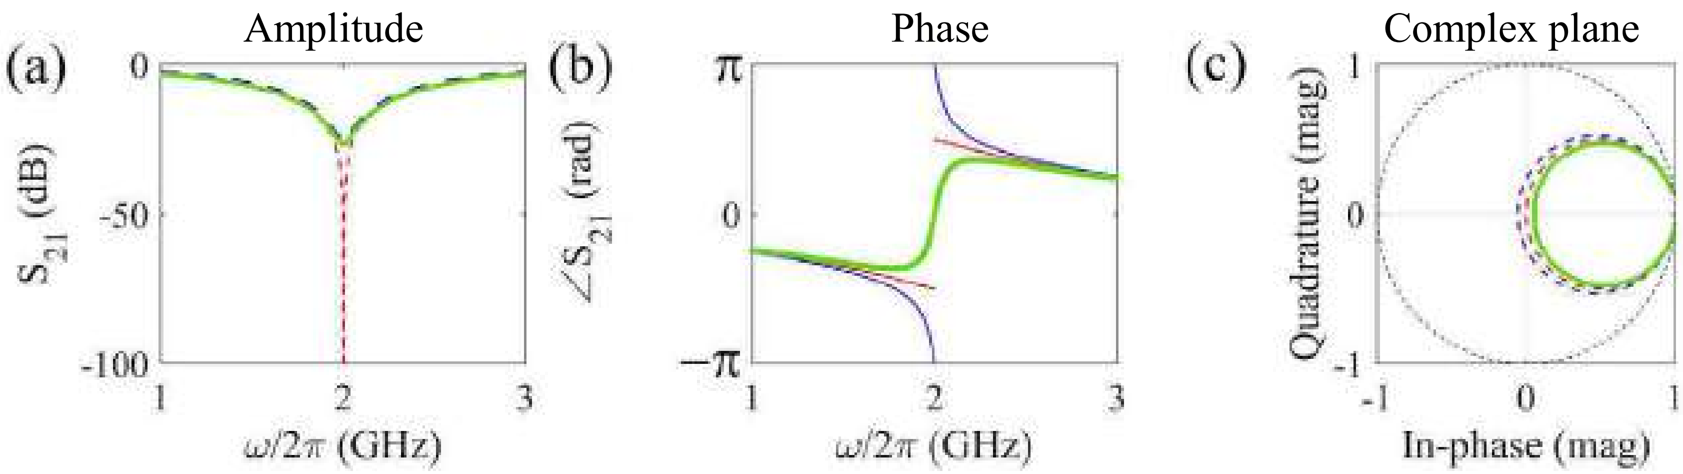
$\kappa = Z_0/4L$ – external damping

$\gamma = R/2L$ – intrinsic damping

Zero damping

Positive damping

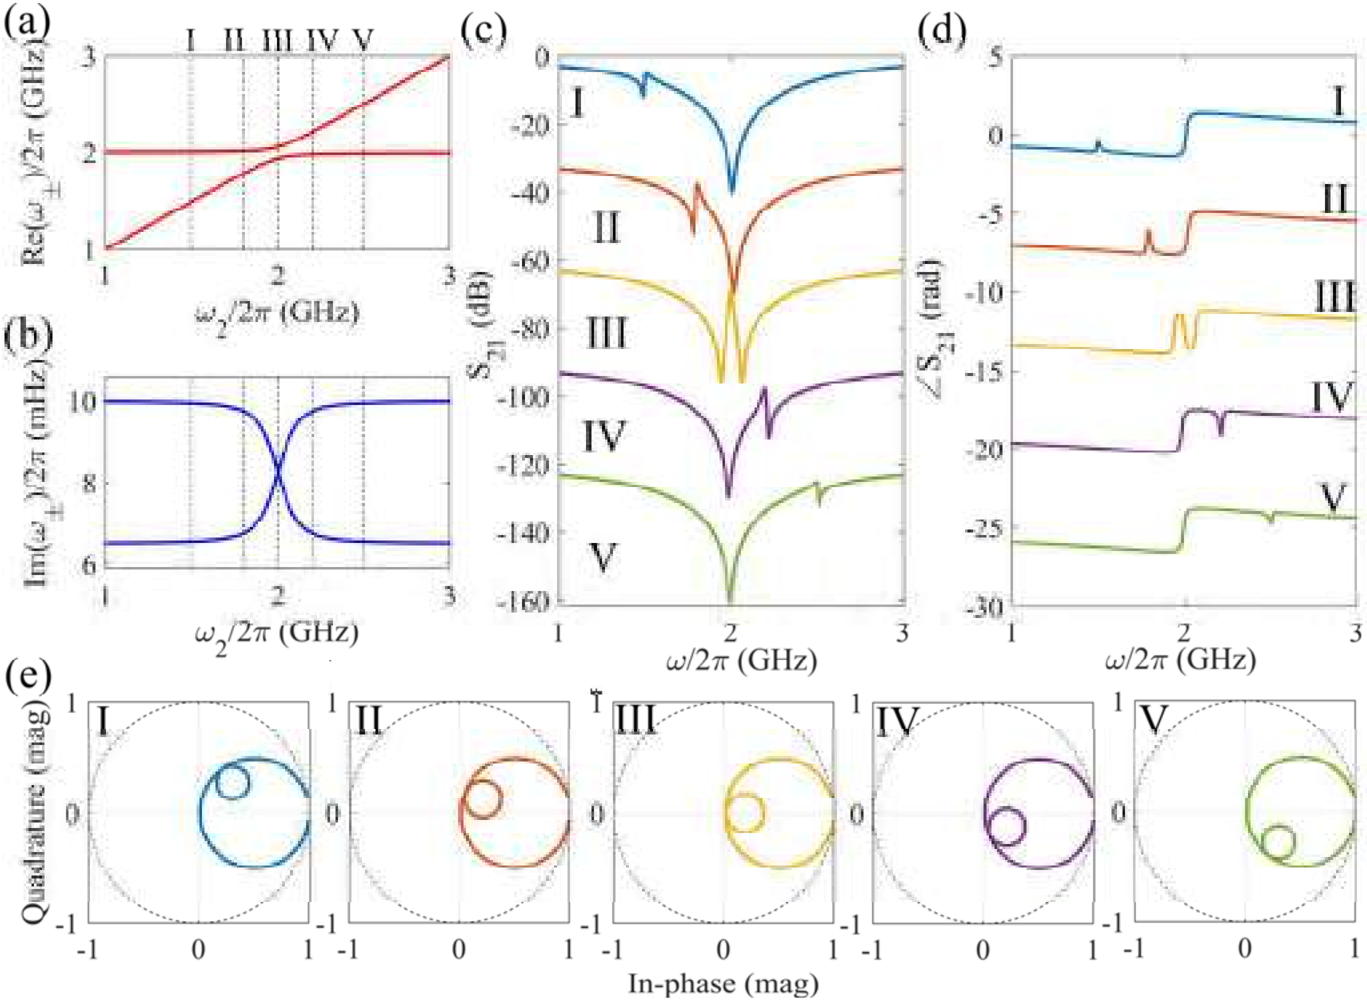
Negative damping



Negative damping/resistance (2)

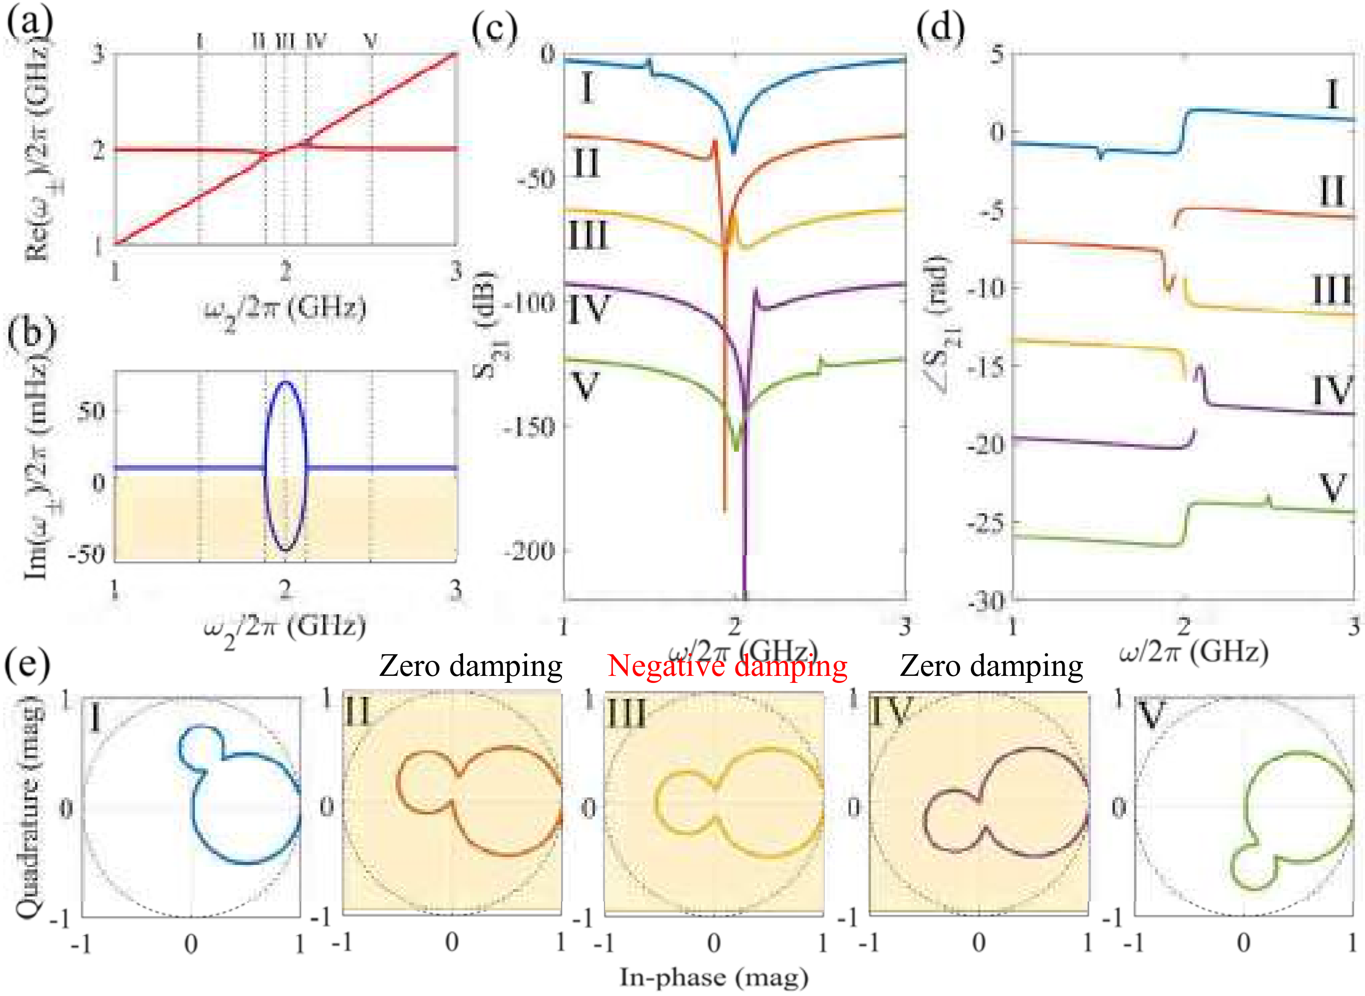
Coherent coupling case

The S21 trajectory always exclude origin, showing the damping is always positive



Negative damping/resistance (3)

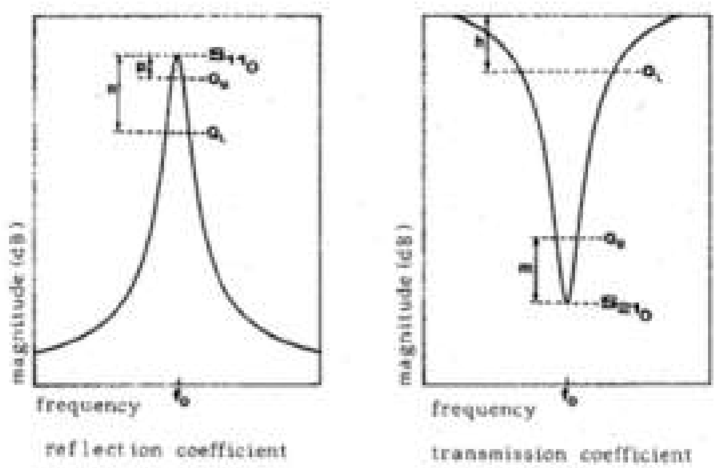
Dissipative coupling case The S21 trajectory sometimes include origin, showing the damping could be zero/negative!



Relation between damping rates and quality factors

Determination of Loaded, Unloaded, and External Quality Factors of a Dielectric Resonator Coupled to a Microstrip Line

APS KHANNA AND Y. GARAULT



External Q factor → intrinsic + external damping

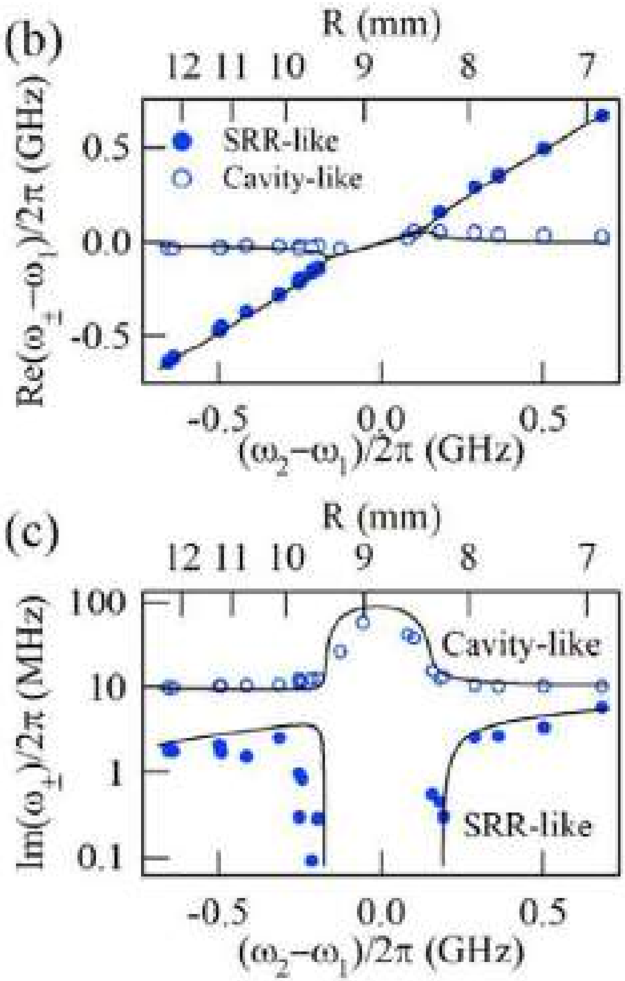
Unloaded Q factor → intrinsic damping ∝ R

Loaded Q factor → external damping

$$Q = \frac{\omega_1}{\Delta\omega}$$

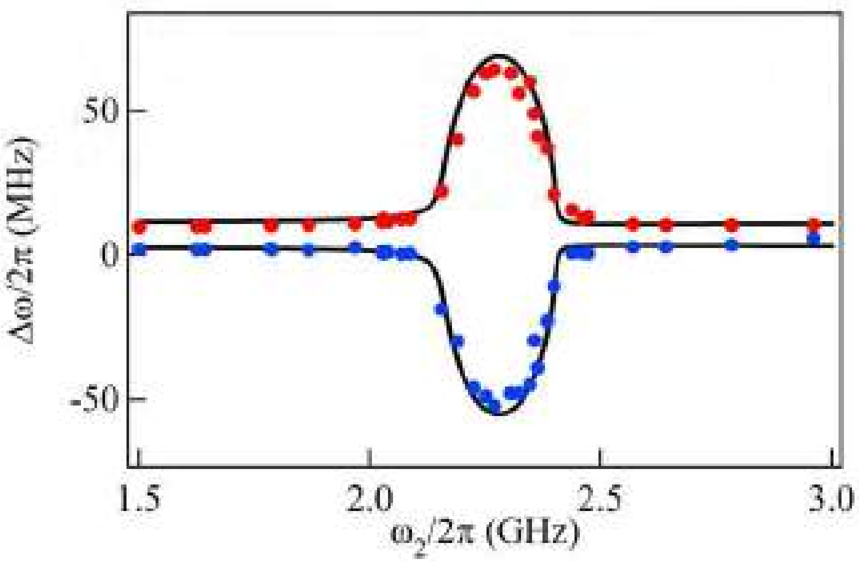
Khanna, A. P. S., and Y. Garault. *IEEE Transactions on Microwave Theory and Techniques* 31.3 (1983): 261-264.

Linewidth evolution for dissipative coupling



Taking phase
into consideration

Linewidth evolution

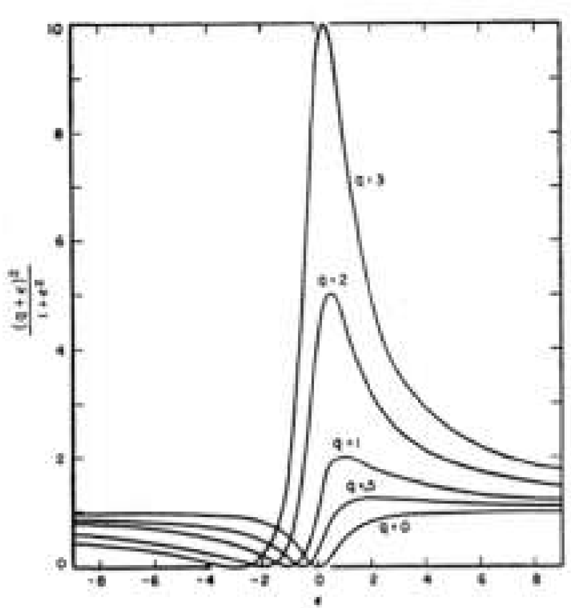


Fano Resonance

In 1961, Ugo Fano discovered a distinctly asymmetric shape while studying the autoionizing states of atoms.

Characteristic : One discrete state and one continuum

$$I \propto \frac{(F\gamma + \omega - \omega_0)^2}{(\omega - \omega_0)^2 + \gamma^2}$$



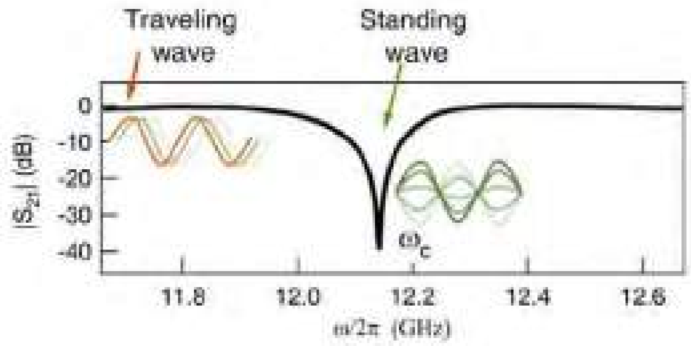
Fano, Ugo. "Effects of configuration interaction on intensities and phase shifts." *Physical Review* 124.6 (1961): 1866.

In our case:

travelling wave → continuum states

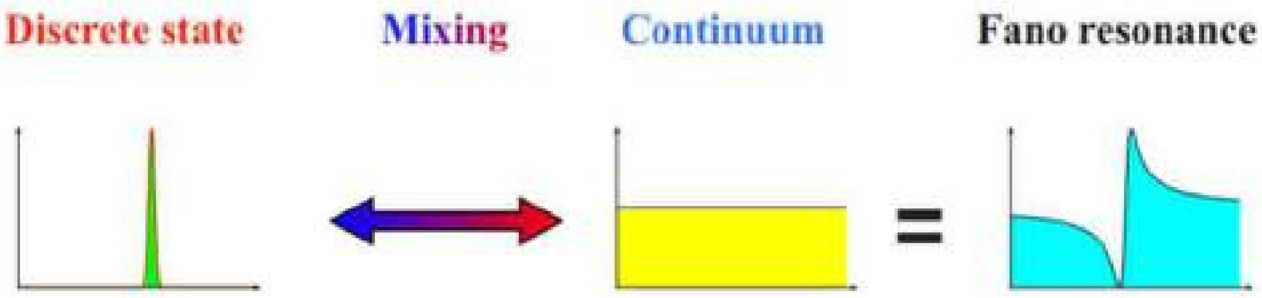
SRR → discrete state

Yao, Bimu, et al. "The microscopic origin of magnon-photon level attraction by traveling waves: Theory and experiment." *Physical Review B* 100.21 (2019): 214426.



Fano Resonance (2)

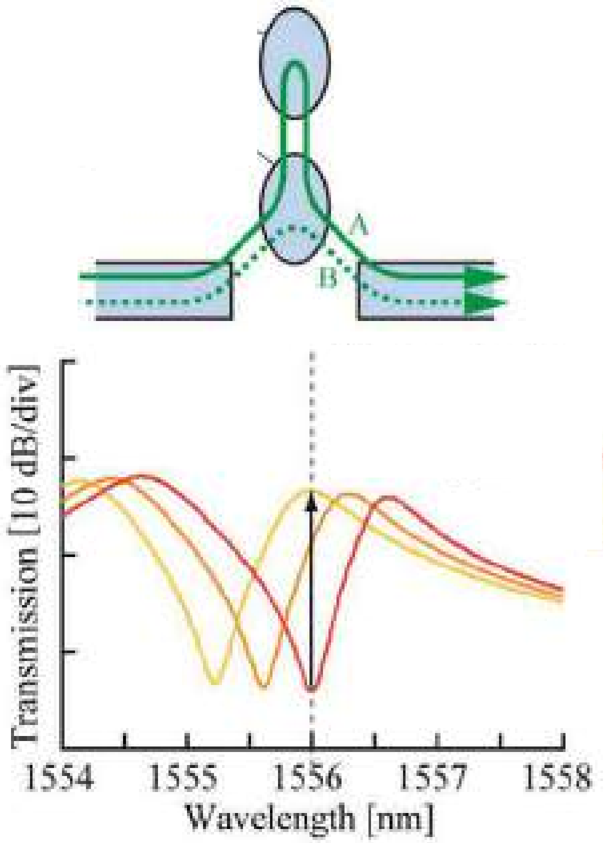
Miroshnichenko, Andrey E., Sergej Flach, and Yuri S. Kivshar.
"Fano resonances in nanoscale structures." *Reviews of Modern Physics* 82.3 (2010): 2257.



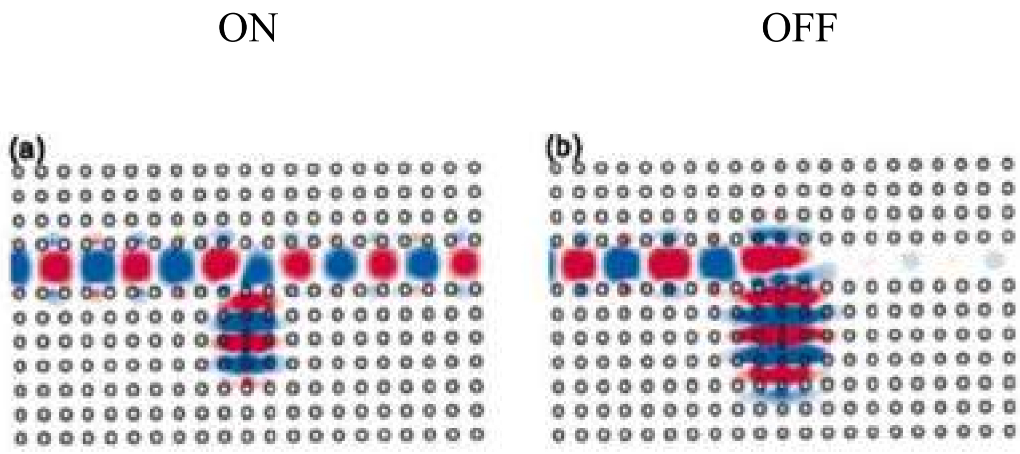
" Such waveguide-cavity systems can naturally exhibit Fano resonances with high quality factors, and they can be used for optical modulations and switching. "

" Therefore, the Fano resonance can be considered as a precursor of BICs, with unique properties that may lead to applications including optical sensors, filters and waveguides, as well as low-loss fibres and large-area lasers. "

Fano Resonance for designing switching devices



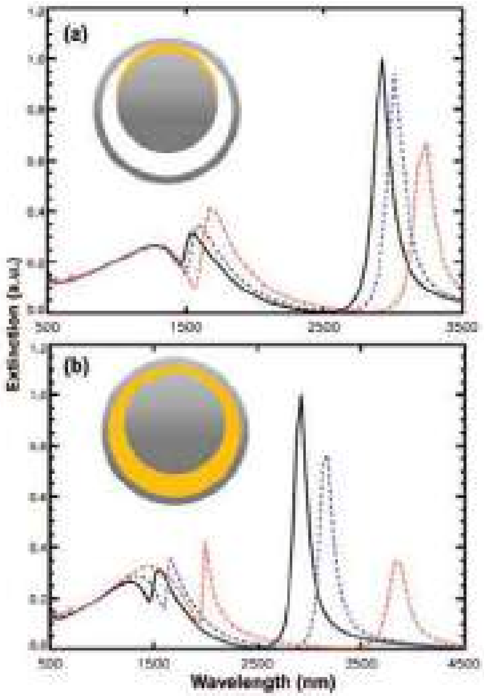
Nozaki, Kengo, et al. "Ultralow-energy and high-contrast all-optical switch involving Fano resonance based on coupled photonic crystal nanocavities." *Optics express* 21.10 (2013): 11877-11888.



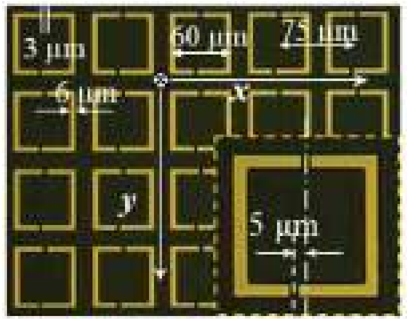
Yanik, Mehmet Fatih, Shanhui Fan, and Marin Soljačić. "High-contrast all-optical bistable switching in photonic crystal microcavities." *Applied Physics Letters* 83.14 (2003): 2739-2741.

Fano Resonance for designing sensors

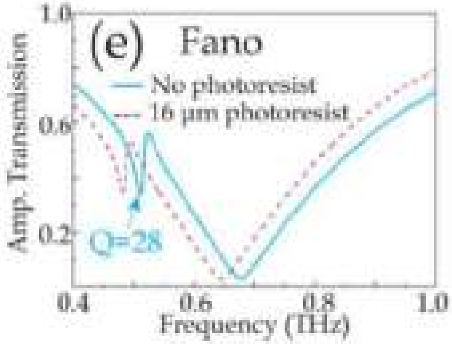
Yellow material:
Dielectric material under test

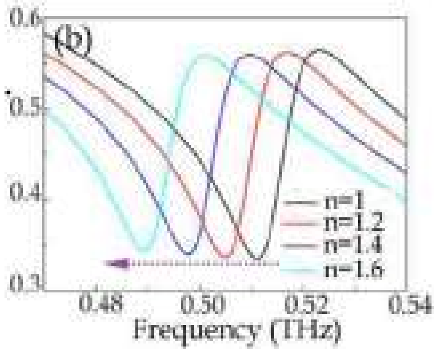


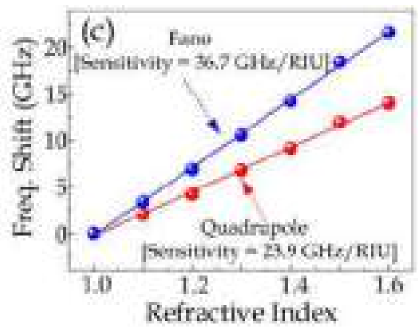
Sensor design



Fano resonance spectrum







Frequency shift

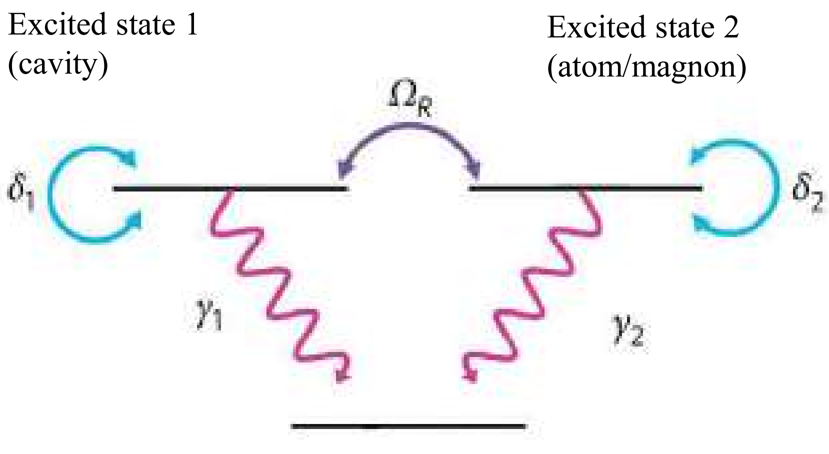
Sensitivity

Hao, Feng, et al. "Symmetry breaking in plasmonic nanocavities: subradiant LSPR sensing and a tunable Fano resonance." *Nano letters* 8.11 (2008): 3983-3988.

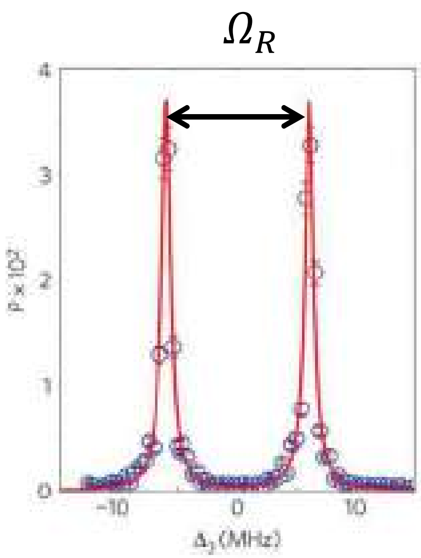
Singh, Ranjan, et al. "Ultrasensitive terahertz sensing with high-Q Fano resonances in metasurfaces." *Applied Physics Letters* 105.17 (2014): 171101.

Rabi Oscillation

A Rabi oscillation is a damped oscillation of an initially excited atom coupled to an electromagnetic resonator or cavity. In this process, atom alternately emits photons into a single-mode electromagnetic cavity and reabsorbs them.



Schematic for a two-level system



Typical frequency-domain observation

Rabi oscillation for coherent coupling – time domain

Match, Christophe, et al. "Transient response of the cavity magnon-polariton." *Physical Review B* 99.13 (2019): 134445.

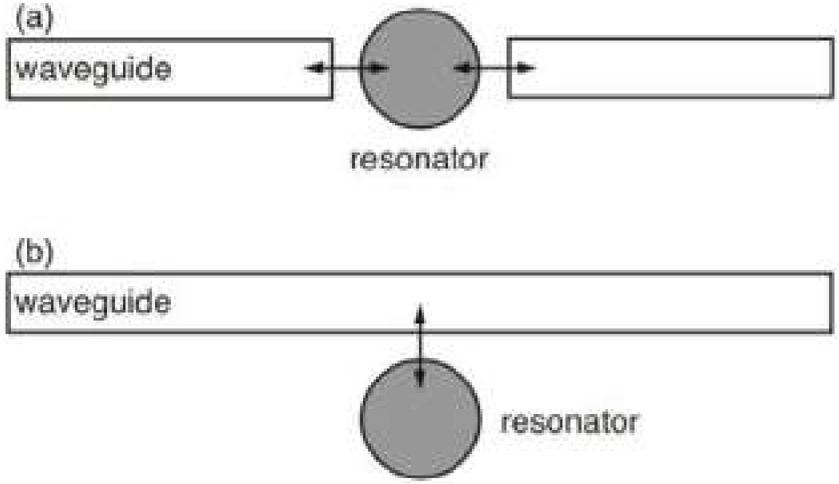

FIG. 17. Typical resonant structures. Schematic setup for (a) a waveguide directly coupled to a cavity and (b) a waveguide side-coupled to a cavity.

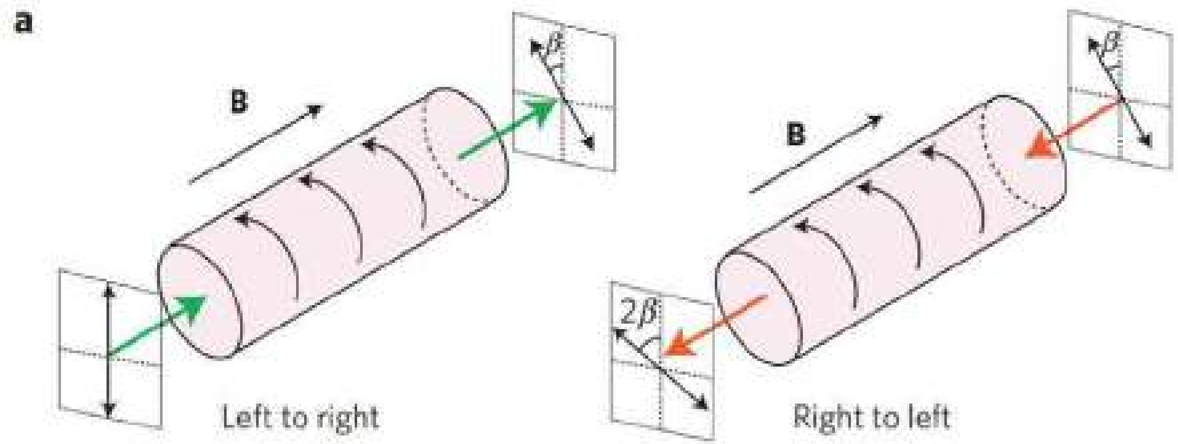
Faraday Rotation

The Faraday effect causes a rotation of the plane of polarization which is linearly proportional to the component of the magnetic field in the direction of propagation.

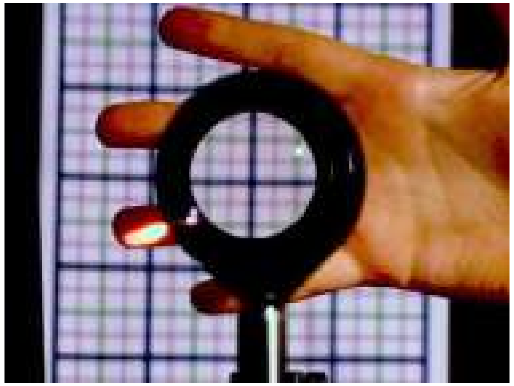


Non-reciprocity can be generated by inserting a polarizer.

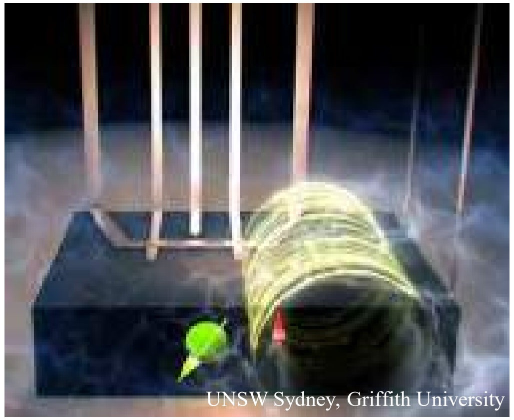
Kamal, Archana, John Clarke, and M. H. Devoret. "Noiseless non-reciprocity in a parametric active device." *Nature Physics* 7.4 (2011): 311-315.

Why do people need nonreciprocal devices?

1. invisible sensing or cloaking
2. noise-free information processing
3. qubit shield / protection
4. Other circuit design



Optical invisibility of a human hand



Shielding qubits from environmental noise

He, Cheng, et al. "One-way cloak based on nonreciprocal photonic crystal." *Applied Physics Letters* 99.15 (2011): 151112.

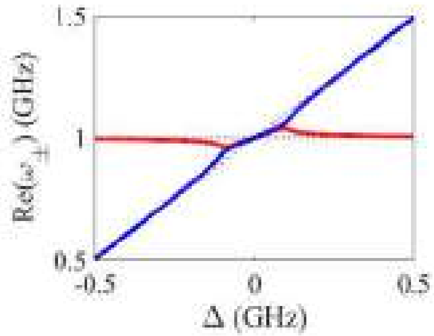
Between oscillators and polaritons

Simplified model to explain the behavior of polariton and pendulums

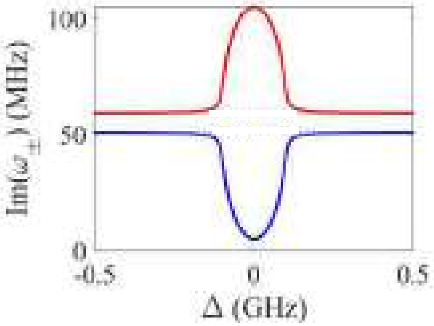
$$\begin{bmatrix} \omega - \widetilde{\omega}_1 - i\Gamma & i\Gamma \\ i\Gamma & \omega - \widetilde{\omega}_2 - i\Gamma \end{bmatrix} \begin{bmatrix} |\varphi_1| \\ |\varphi_2| \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix} \qquad \begin{bmatrix} \omega - \widetilde{\omega}_1 & i\Gamma \\ i\Gamma & \omega - \widetilde{\omega}_2 \end{bmatrix} \begin{bmatrix} |\varphi_1| \\ |\varphi_2| \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$$

Mechanical oscillators

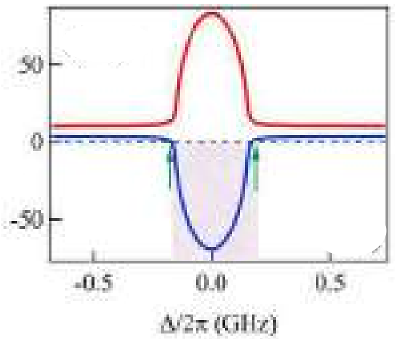
Polaritons



Mechanical systems

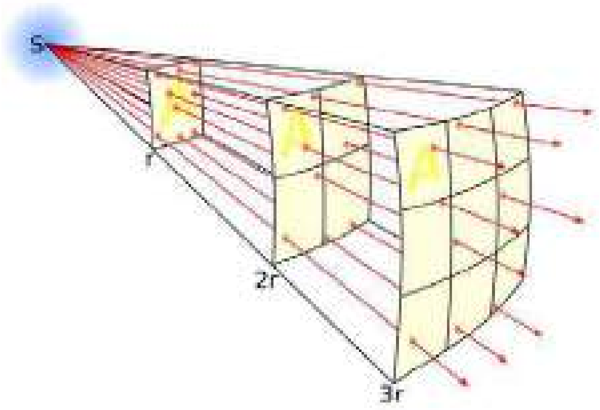


Polariton systems



Damping control by Inverse-square law

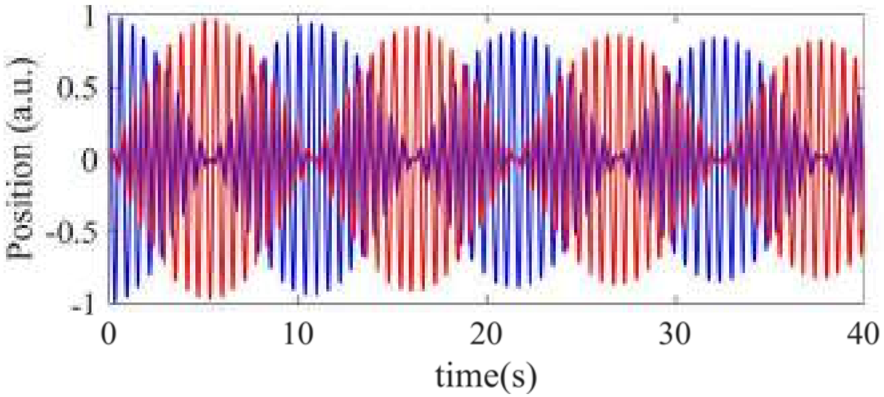
Suppose the magnetic loop antenna introduce an anisotropic environment with certain area around magnon.



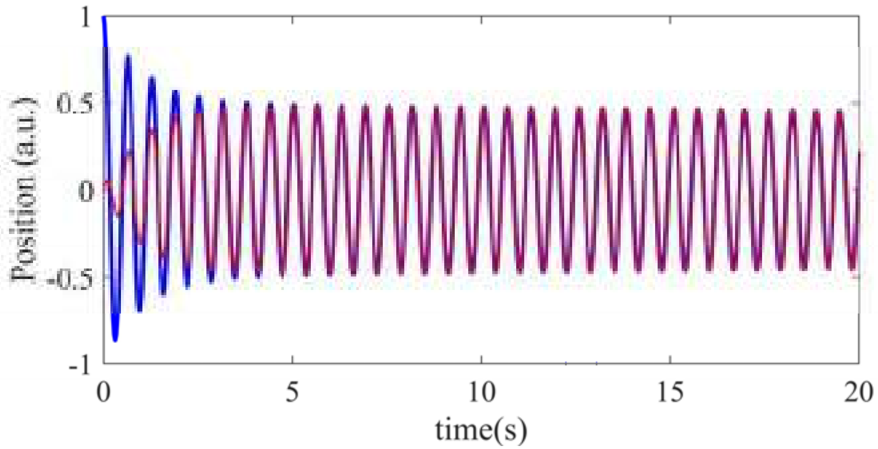
This area influence the environment would decay with the inverse-square law

Calculation parameter for ODEs solvers

Coherent coupling - Rabi Oscillation like



Dissipative coupling - Synchronization like



$J = 0.5\ Hz$

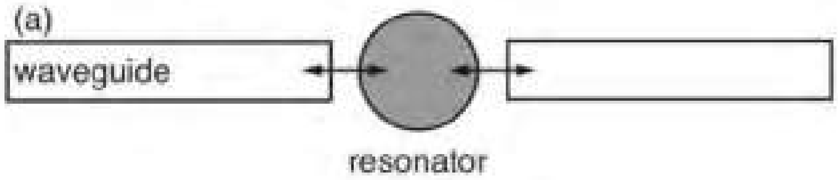
$\omega_1 = \omega_2 = 10\ Hz$

$\Delta\omega_1 = \Delta\omega_2 = 0.01\ Hz$

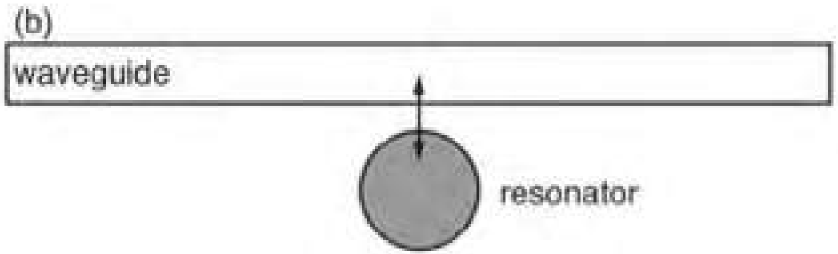
$\Gamma = 0.5\ Hz$

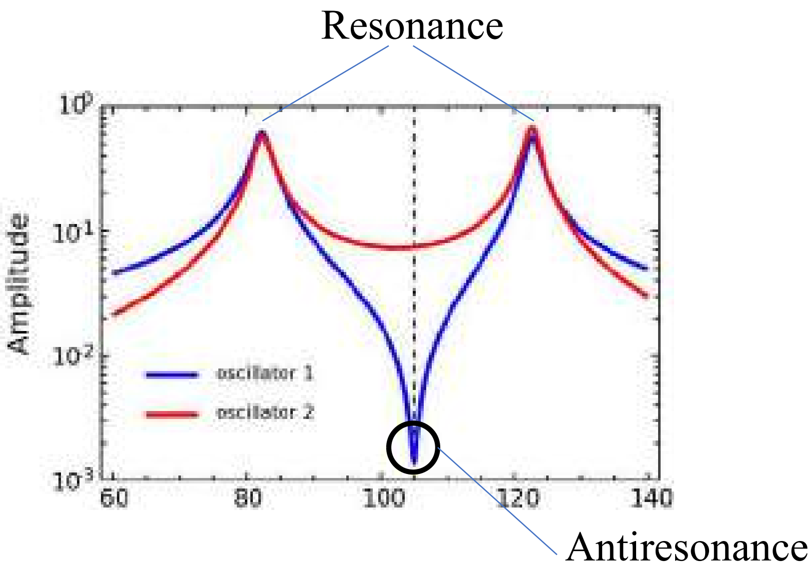
Antiresonance

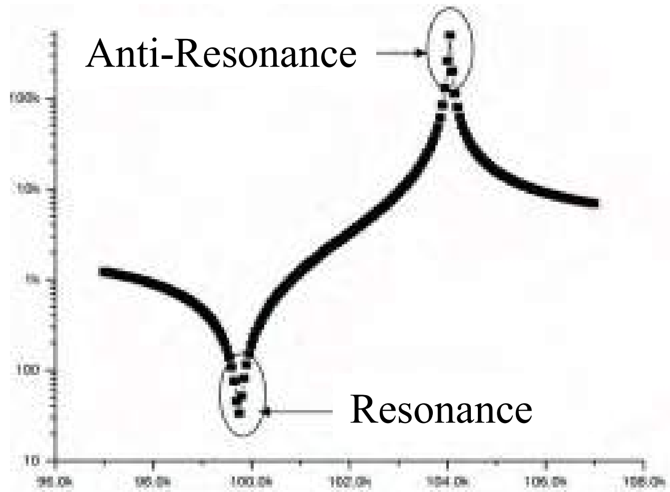
Directly coupled resonator



Side coupled resonator





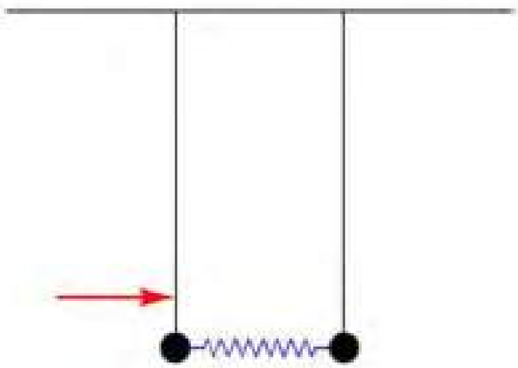


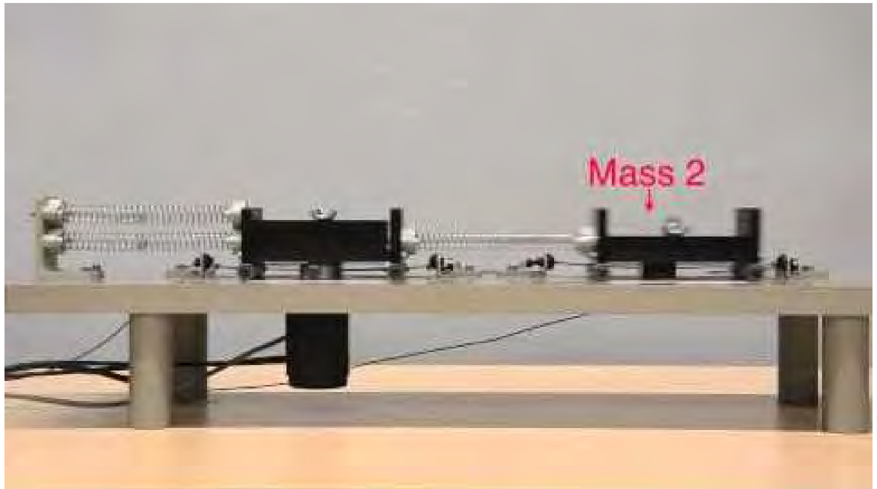
Journal of Electrical Engineering & Technology 12.2 (2017): 846-851.

→ Minimum response to external driving

Antiresonance (2) video demonstration

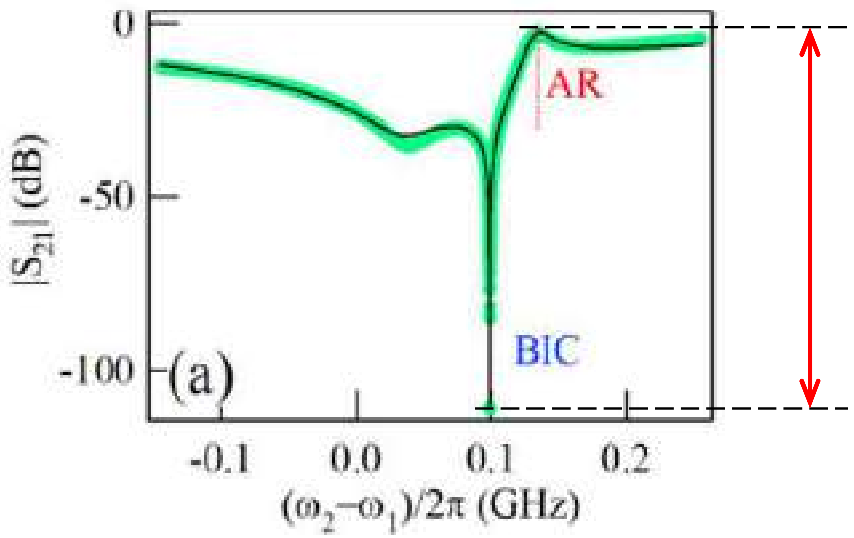
Minimum response to external driving

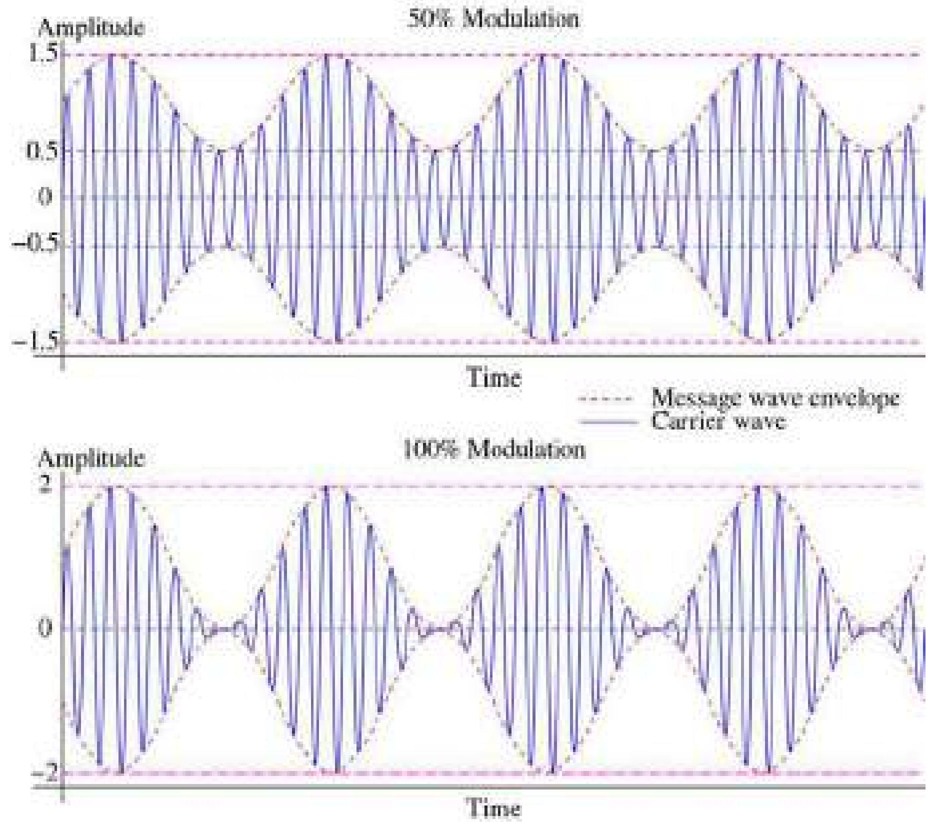




Modulation depth

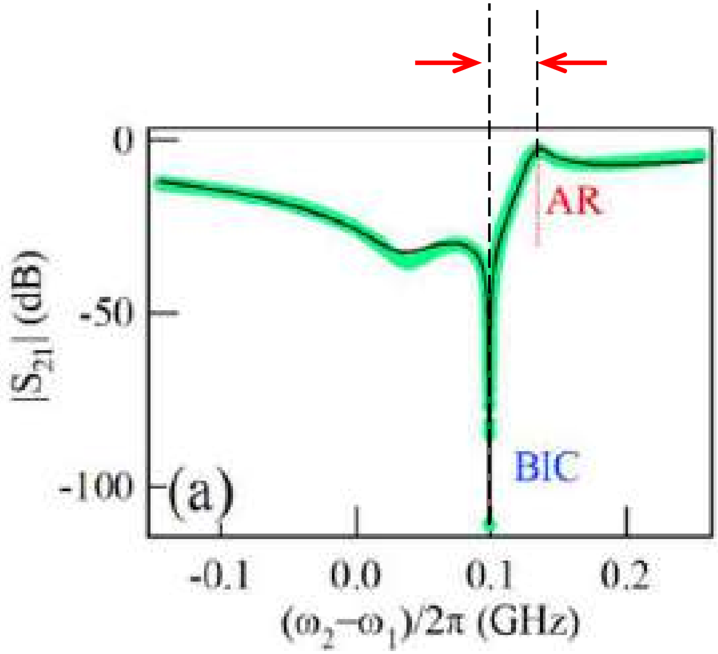
A relative modulation amplitude, or the maximum change in transmission.



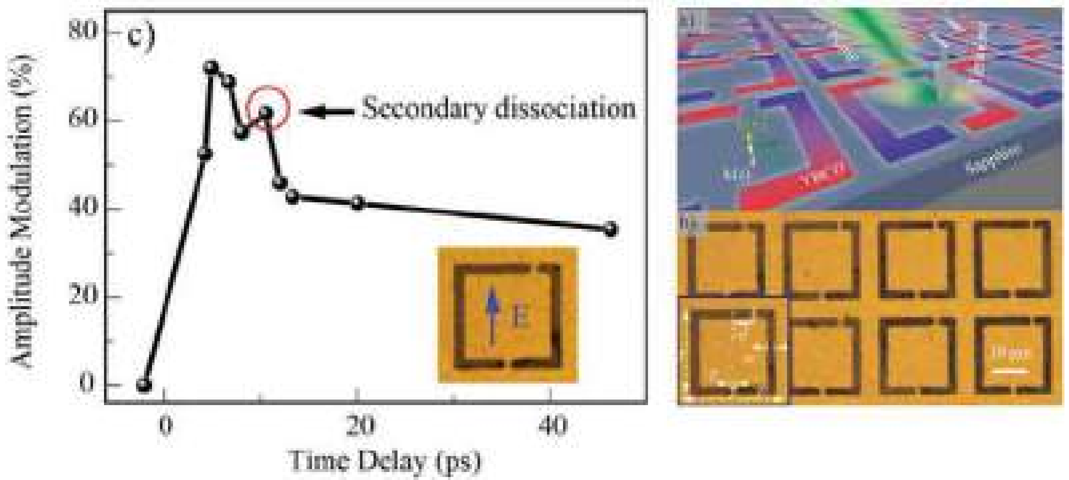


Switching window

The frequency window between the transmission 1 to zero



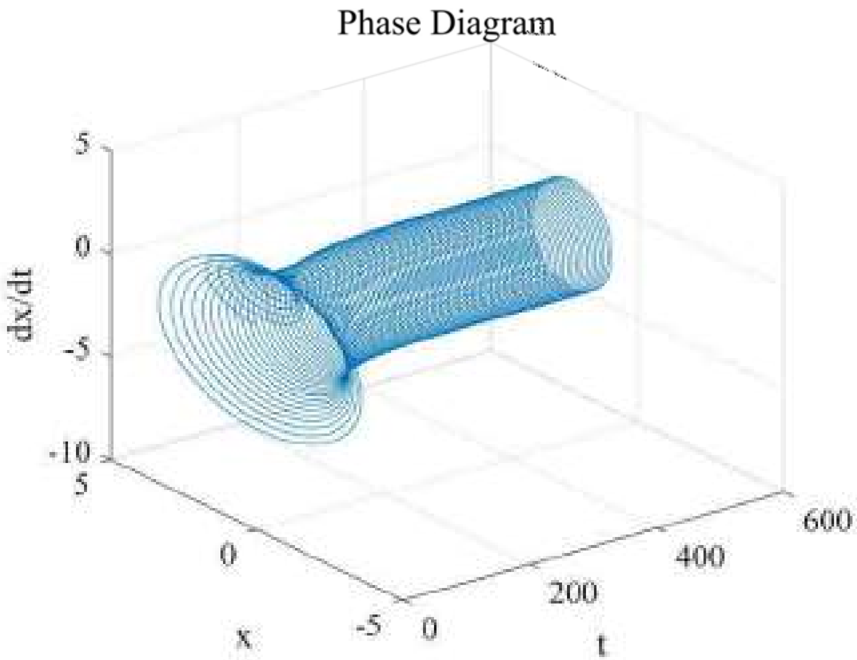
Application: Ultrafast switch

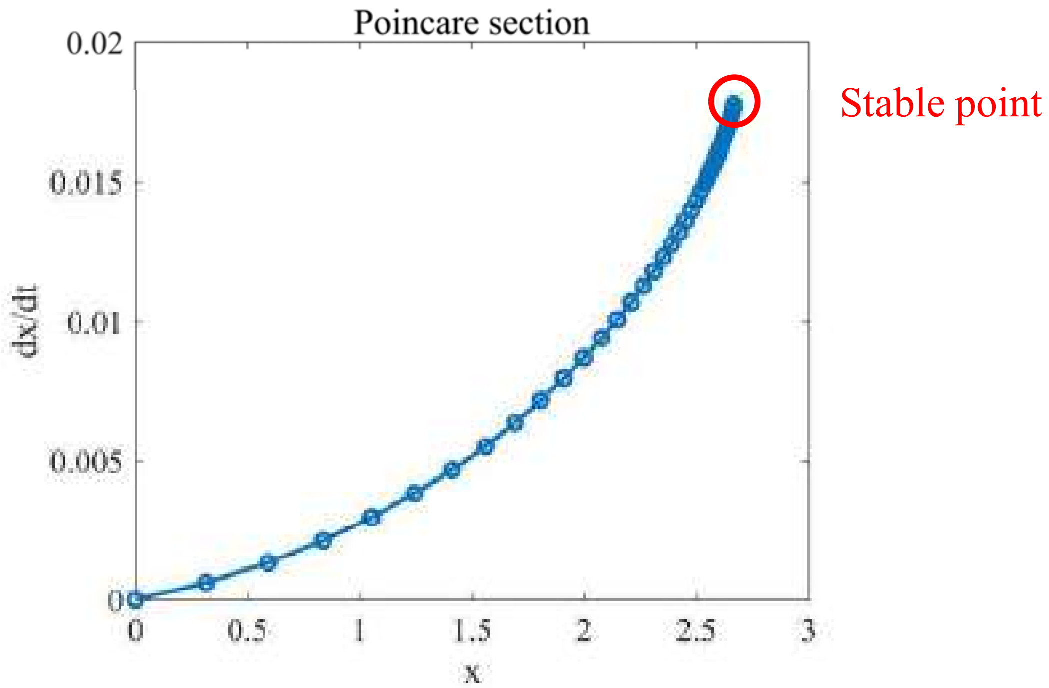


Srivastava, Yogesh Kumar, et al. "A Superconducting Dual-Channel Photonic Switch." *Advanced materials* 30.29 (2018): 1801257.

ODEs solvers for nonlinear / chaotic analysis (1)

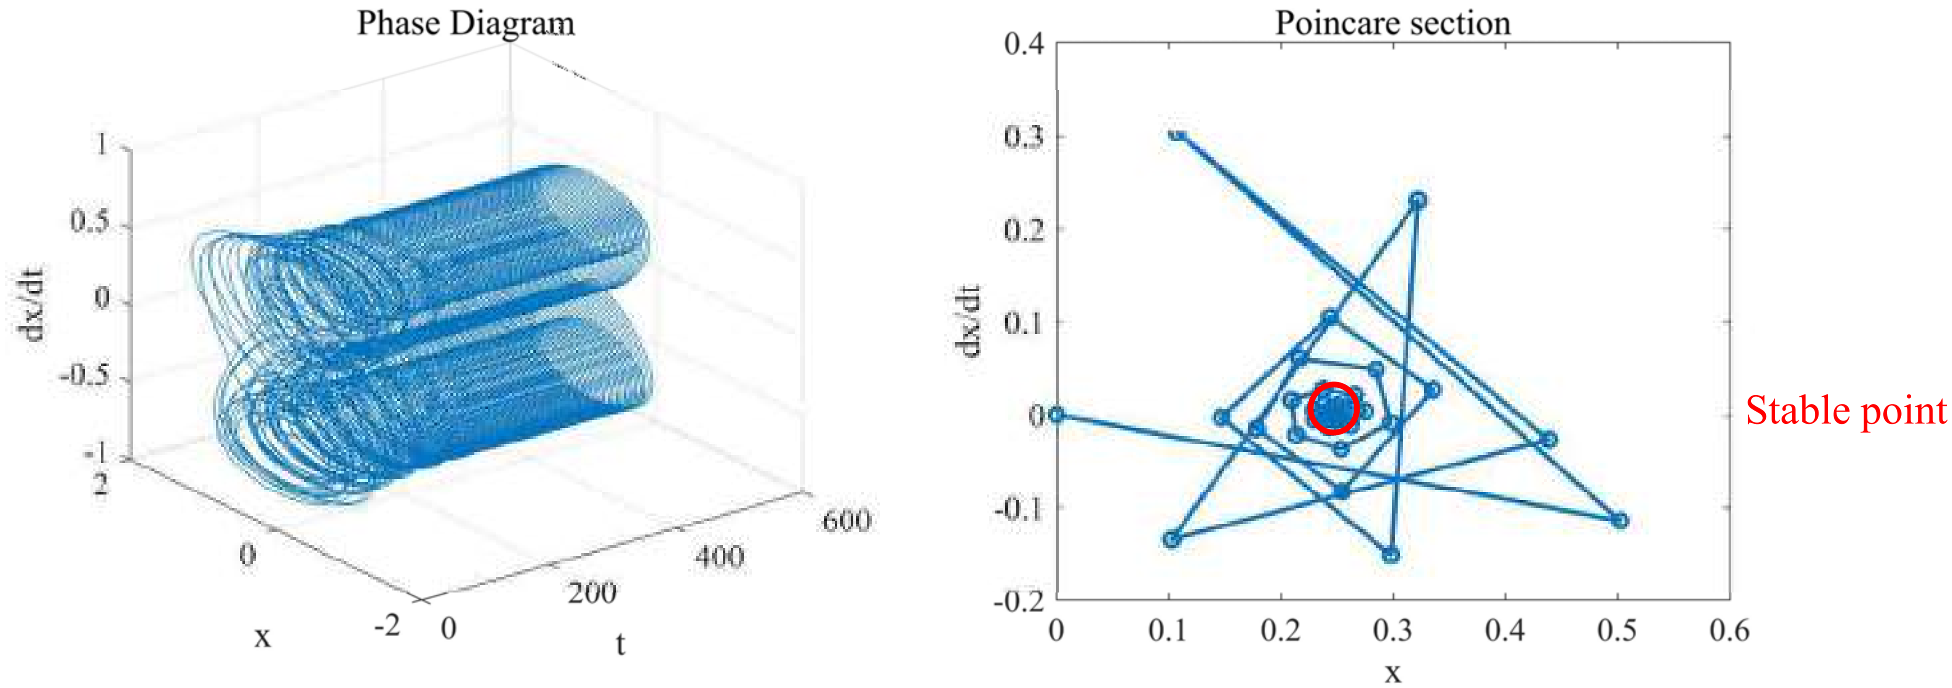
For a **linear** oscillator with driving force, we can calculate the trajectory.





ODEs solvers for nonlinear / chaotic analysis (2)

For a **nonlinear** oscillator with driving force, we can calculate the trajectory.



ODEs solvers for nonlinear / chaotic analysis (1)

For a **chaotic** oscillator with driving force, we can calculate the trajectory that depends on initial conditions.
